1 Introduction

This document contains a description of NMEA output sentences, NMEA commands, and special OSP / Binary Protocol commands which are implemented in the standard GPS firmware used in all GPS modules based on the SiRFstarIV GSD4e chip: A2100's. For more details of the original SiRF firmware please see chapter "6.2 Related Documents".

This revision of the manual refers to firmware **4.0.1!**

The purpose of this paper is the explanation of the behavior of the "NMEA" interface, i.e. a description of the outputs coming from this interface, and a summary of the commands that can be issued to this interface. In addition it shows usage of SiRFawareTM and PTF mode. This will allow easy and full adjustment and control of the module.

1.1 Serial Port Configuration

The firmware supports the bi-directional serial interface of Vincotech's GPS modules. It is implemented by use of the full duplex UART (Universal Asynchronous Receiver Transmitter) interface of the GPS processor. Please note that it is necessary to configure the module with an external configuration resistor for UART mode with the standard 4.0.1 firmware.

- For the communication with UART the use of a kind of terminal program or another appropriate method is necessary.
- NMEA communication is always on port 0 (pin Tx0 and Rx0) of the module or on the serial USB port of one of the evaluation boards, respectively.
- The default configuration of this serial port is: 4800 baud, 8 data bits, no parity, 1 stop bit, no flow control.

This interface is bi-directional, i.e. on the one side the output of the GPS modules (NMEA sentences, etc.) is sent to the UART interface, on the other side the UART interface can be used to send commands to Vincotech's GPS modules.

1.2 Cold Start Behaviour

After an initial power on the module will start with a sequence like this:

```
$GPGGA,,,0,00,,,M,0.0,M,,0000*48  
$GPGSA,*6E  
$GPRMC,*,4B  
$GPGGA,,,0,00,,,M,0.0,M,,0000*48  
$GPGSA,*6E  
$GPRMC,*,4B  
...
```

In NMEA mode the firmware will not report time, date or any signal information, until a position fix can be calculated. Therefore, also the GPGSV sentence is missing. If this information is required, it is necessary to switch to SiRF Binary mode.

1.2.1 Additional Output Messages

Occasionally, the following message can be seen:

- \$PSRF156,23,1,0*09

This is the receiver's message to request a download. The download can be started immediately.

In addition the following message (or a similar one) can be seen:

- \$PSRF151,2,0,30094,0xFFFFFFFF*56

With this message the receiver is showing GPS data (time valid, week, time of week) and the Ephemeris mask. The Ephemeris mask is indicating which satellite's Ephemeris data should still be loaded.

1.2.2 InstantFix – Extended Ephemeris Support

The firmware supports both Client generated as well as Server generated Extended Ephemeris (EE) data. Client generated data are calculated automatically, as soon as broadcasted Ephemeris data are available. The validity of these data is up to three days. For details about the Server generated EE data, please refer to the application notes

- GPS AppNote EE Receiver Load (Vincotech)
- GPS AppNote EE Server Download (Vincotech)

2 Standard NMEA Sentences

2.1 Introduction

The **N**ational **M**arine **E**lectronics **A**ssociation created a uniform interface standard for digital data exchange between different marine electronic products back in the early nineteen-eighties.

- NMEA information is transmitted from a 'vendor' in 'sentences' with a maximum length of 80 characters.
- The general format is:
"\$<vendor><message><parameters>*<checksum><CR><LF>".
- The combination of <vendor><message> is called address field.
- The vendor code for the Global Positioning System is "GP".
- In this document NMEA sentences refer to the NMEA 0183 Standard.

For details see:

<http://www.nmea.org/>
<http://www.nmea.org/pub/index.html>

2.2 Supported NMEA Sentences

The Vincotech's GPS firmware currently supports 6 NMEA sentences:

- \$GPGGA (default: ON)
- \$GPVTG (default: OFF)
- \$GPGSA (default: ON)
- \$GPRMC (default: ON)
- \$GPGSV (default: ON, 0.2Hz)
- \$GPGLL (default: OFF)

Note: Please consider max transfer rate (depending on baud rate setting) before activating additional NMEA sentences.

The following paragraphs give an overview of NMEA messages with example strings and short explanation.

2.2.1 GGA - Global Positioning System Fix Data

| | | |
|---|------------|---|
| e.g. \$GPGGA,152145.000,4805.8193,N,01132.2317,E,1,04,2.5,607.5,M,47.6,M,,*67 | | |
| (1) | \$GPGGA | Vendor and message identifier |
| (2) | 152145.000 | Universal time coordinated (15h 21m 45.000s) |
| (3) | 4805.8193 | Latitude (48deg 05.8193min) |
| (4) | N | N North S South |
| (5) | 01132.2317 | Longitude (011deg 32.2317min) |
| (6) | E | E East W West |
| (7) | 1 | Fix quality: 0 fix not valid or invalid, 1 GPS SPS mode, fix valid, 2 Differential GPS, SPS mode, fix valid |
| (8) | 04 | Four satellites in use (min 00, max 12) |
| (9) | 2.5 | Horizontal dilution of precision |
| (10) | 607.5 | MSL altitude |
| (11) | M | Unit of antenna altitude: meters |
| (12) | 47.6 | Geoidal separation |
| (13) | M | Unit of geoidal separation: meters |
| (14) | <empty> | Age of differential GPS data, null field when DGPS is not used |
| (15) | <empty> | Differential reference station ID, null field when DGPS is not used |
| (16) | *67 | Checksum |

Table 1: GGA example and description

2.2.2 VTG – Course Over Ground and Ground Speed

| | | |
|--|---------|--|
| e.g. \$GPVTG,169.31,T,,M,0.31,N,0.5,K,A*6B | | |
| (1) | \$GPVTG | Vendor and message identifier |
| (2) | 169.31 | Track degrees |
| (3) | T | True |
| (4) | <empty> | Track degrees |
| (5) | M | Magnetic |
| (6) | 0.31 | Horizontal speed [knots] |
| (7) | N | Knots |
| (8) | 0.5 | Horizontal speed [kilometers per hour] |
| (9) | K | Kilometers per hour |
| (10) | A | A Autonomous mode D Differential mode E Estimated/dead reckoning |
| (11) | *6B | Checksum |

Table 2: VTG example and description

2.2.3 RMC - Recommended Minimum Specific GPS Data

e.g. \$GPRMC,092516.000,A,4805.8021,N,01132.2243,E,1.91,183.81,270302,0.0,W,A*7B

| | | |
|------|--------------------|--|
| (1) | \$GPRMC | Vendor and message identifier |
| (2) | 092516.000 | UTC - Universal Time Coordinated (09h 25m 16.000s) |
| (3) | A | A Fix valid V for invalid or no fix |
| (4) | 4805.8021 | Latitude (48deg 05.8021min) |
| (5) | N | N North S South |
| (6) | 01132.2243 | Longitude (011deg 32.2243min) |
| (7) | E | E East W West |
| (8) | 1.91 | Speed over ground in knots |
| (9) | 183.81 | Course over ground, degrees true |
| (10) | 270302 | Date (ddmmyy – 27 th March 2002) |
| (11) | 0.0 ⁽¹⁾ | Magnetic variation, degrees |
| (12) | W ⁽¹⁾ | W West E East |
| (13) | A | A Autonomous mode D Differential Mode E Estimated/dead reckoning |
| (14) | *7B | Checksum |

(1) SiRF Technology Inc. does not support magnetic declination. All course over ground data are geodetic WGS84 directions

Table 3: RMC example and description

2.2.4 GSA - GPS DOP and Active Satellites

| | | |
|---|---------|---|
| e.g. \$GPGSA,A,3,03,20,14,31,,,,,,,,,3.7,2.5,2.8*3D | | |
| (1) | \$GPGSA | Vendor and message identifier |
| (2) | A | A 2D automatic – allowed to automatically switch 2D/3D M Manual – forced to operate in 2D or 3D mode |
| (3) | 3 | 1 Fix not available 2 2D fix (<4 SVs used) 3 3D fix (>3 SVs used) |
| (4) | 03 | ID of satellite used in 1 st channel |
| (5) | 20 | ID of satellite used in 2 nd channel |
| ... | | ... |
| (23) | <empty> | ID of satellite used in 12 th channel |
| (24) | 3.7 | PDOP in meters |
| (25) | 2.5 | HDOP in meters |
| (26) | 2.8 | VDOP in meters |
| (27) | *3D | Checksum |

Table 4: GSA example and description

2.2.5 GSV – GPS Satellites in View

| e.g. \$GPGSV,1,1,04,03,27,159,45,14,43,095,48,20,17,231,40,31,60,190,42*7F | | |
|--|---------|---|
| (1) | \$GPGSV | Vendor and message identifier |
| (2) | 1 | Total numbers of messages |
| (3) | 1 | Number of current message |
| (4) | 04 | Satellites in view |
| (5) | 03 | Satellite number of 1 st satellite |
| (6) | 27 | Elevation in degrees of 1 st satellite |
| (7) | 159 | Azimuth in degrees to true of 1 st satellite |
| (8) | 45 | SNR (signal to noise ratio) in dB of 1 st satellite (00 when not tracking) |
| (9) | 14 | Satellite number of 2 nd satellite |
| (10) | 43 | Elevation in degrees of 2 nd satellite |
| (11) | 095 | Azimuth in degrees to true of 2 nd satellite |
| (12) | 48 | SNR (signal to noise ratio) in dB of 2 nd satellite (00 when not tracking) |
| (13) | 20 | Satellite number of 3 rd satellite |
| (14) | 17 | Elevation in degrees of 3 rd satellite |
| (15) | 231 | Azimuth in degrees to true of 3 rd satellite |
| (16) | 40 | SNR (signal to noise ratio) in dB of 3rd satellite (00 when not tracking) |
| (17) | 31 | Satellite number of 4 th satellite |
| (18) | 60 | Elevation in degrees of 4 th satellite |
| (19) | 190 | Azimuth in degrees to true of 4 th satellite |
| (20) | 42 | SNR (signal to noise ratio) in dB of 4th satellite (00 when not tracking) |
| (21) | *7F | Checksum |

Table 5: GSV example and description

2.2.6 GLL – Latitude, Longitude, UTC and status

| | | |
|---|------------|--|
| e.g. \$GPGLL,3723.2475,N,12158.3416,W,161229.487,A,A*41 | | |
| (1) | \$GPGSV | Vendor and message identifier |
| (2) | 3723.2475 | Latitude (37deg 23.2475min) |
| (3) | N | N North S South |
| (4) | 12158.3416 | Longitude (121deg 58.3416min) |
| (5) | W | W West E East |
| (6) | 161229.487 | UTC - Universal Time Coordinated (16h 12m 29.487s) |
| (7) | A | A Data valid V Data not valid |
| (8) | A | A Autonomous mode D DGPS mode E DR mode |
| (9) | *41 | Checksum |

Table 6: GLL example and description

3 Proprietary NMEA Sentences

NMEA input messages enable you to control the receiver while in NMEA protocol mode. By default, the receiver is configured for NMEA mode on port 0. Messages can be sent by using a terminal program, by using Vincotech's GPS Cockpit software, or the SiRFdemo and SiRFLive software. If the receiver is in SiRF binary mode, all NMEA input messages are ignored. Once the receiver is put into NMEA mode, the following messages may be used to command the module.

All settings transmitted by NMEA or binary messages are stored in SRAM; as long as Vcc is supplied the settings are maintained.

The GPS module falls back to factory settings in case Vcc is disconnected.

3.1 Transport Message

Device manufacturer define extensions of the standard NMEA protocol or sentences thereof.

The general format is:

"\$<vendor><MID><parameters><*cksum><CR><LF>".

| | |
|-------------|---|
| Vendor: | GSD4e-based products use "PSRF" |
| MID: | Message identifier consisting of three numeric characters. Input Messages begin at MID 100. |
| Parameters: | Message specific parameters refer to a specific section for <data> ... <data> definition. |
| Cksum: | Two hex character checksum as defined in the NMEA specification. Use of checksum is required on all input messages! |
| <CR><LF> | A "Carriage Return" and "Line Feed" is mandatory to complete the NMEA message. |

Note1: All fields in all proprietary NMEA messages are required, none are optional. All NMEA messages are comma delimited.

Note2: GPS Cockpit, SiRFdemo, and SiRFLive software support the calculation of a checksum.

3.2 NMEA Input Messages

The following NMEA input messages are supported.

| Message | MID ⁽¹⁾ | Description |
|-------------------------|--------------------|---|
| Set serial port | 100 | Set Port 0 parameters and protocol |
| Reset Configuration | 101 | Initialize various start up behaviors |
| Query/rate control | 103 | Query standard NMEA message and/or set output rate |
| Development data On/Off | 105 | Development Data messages On/Off |
| Select Datum | 106 | Selection of datum to be used for coordinate transforming |

(1) Message Identification (MID)

Table 7: NMEA Input Messages

Note: NMEA input messages 100 to 106 are SiRF proprietary NMEA messages.

3.3 Serial Port Set-up

This command message is used to set the protocol (SiRF binary or NMEA) and/or the communication parameters (baud rate, data bits, stop bits, and parity). Generally, this command is used to switch the module back to SiRF binary protocol mode where a more extensive command message set is available. When a valid message is received, the parameters are stored in battery-backed SRAM and the GSD4e-based products will restart using the saved parameters.

- \$PSRF100,0,9600,8,1,0*0C

| Name | Example | Description |
|------------|-----------|---|
| Message ID | \$PSRF100 | PSRF100 protocol header |
| Protocol | 0 | 0 SiRF binary / 1 NMEA |
| Baud | 9600 | 4800, 9600, 19200, 38400, 57600, 115200 |
| DataBits | 8 | 8, 7 ⁽¹⁾ |
| StopBits | 1 | 0, 1 |
| Parity | 0 | 0 none / 1 odd / 2 even |
| Checksum | *0C | End of message termination |

(1) SiRF binary protocol is only valid for 8 data bits, 1 stop bit and no parity

Table 8: Serial Port Set-up

3.4 Reset Configuration (*SiRF's original: NavigationInitialization*)

This command is used to configure various reset situations (Hot Start, Warm Start and Cold Start).

- \$PSRF101,0,0,0,0,0,0,12,4*10

| Name | Example | Units | Description |
|--------------|-----------|---------|--|
| Message ID | \$PSRF101 | | PSRF101 protocol header |
| ECEF X | | meters | X coordinate position |
| ECEF Y | | meters | Y coordinate position |
| ECEF Z | | meters | Z coordinate position |
| ClkOffset | | Hz | Clock Offset of the GSD4e-based product ⁽¹⁾ |
| TimeOfWeek | | seconds | GPS Time Of Week |
| WeekNo | | | GPS Week Number |
| ChannelCount | 12 | | Range 1 to 12 |
| ResetCfg | 4 | | Reset configurations: See Table 10 |
| Checksum | *10 | | End of message termination |

- (1) Use 0 for last saved value if available. If this is unavailable, a default value of 96,000 is used

Table 9: Navigation Initialization

| Hex | Description |
|------|---|
| 0x01 | Hot Start— All data valid |
| 0x02 | Warm Start—Ephemeris cleared |
| 0x04 | Cold Start—Clears all data in memory |
| 0x08 | Clear Memory—Clears all data in memory and resets the receiver back to factory defaults |

Table 10: Reset configurations

3.5 Query/Rate control

This command is used to control the output of standard NMEA messages GGA, GLL, GSA, GSV, RMC, and VTG. Using this command message, standard NMEA messages may be polled once, or setup for periodic output. Checksums may also be enabled or disabled depending on the needs of the receiving program. NMEA message settings are saved in battery-backed memory for each entry when the message is accepted.

Table 11 contains the input values for the following examples:

1. Query the GGA message with checksum enabled
 - \$PSRF103,00,01,00,01*25
2. Enable VTG message for a 1 Hz constant output with checksum enabled
 - \$PSRF103,05,00,01,01*20
3. Disable VTG message
 - \$PSRF103,05,00,00,01*21

| Name | Example | Units | Description |
|-------------|-----------|---------|---|
| Message ID | \$PSRF103 | | PSRF103 protocol header |
| Msg | 00 | | See Table 12 |
| Mode | 01 | | 0=SetRate, 1=Query |
| Rate | 00 | seconds | Output rate 0 off Max 255 |
| CksumEnable | 01 | | 0 Disable Checksum 1 Enable Checksum |
| Checksum | *25 | | End of message termination |

Table 11: Query/Rate Control Data Format (see example 1)

| Value | Description |
|-------|---------------------------------------|
| 0 | GGA |
| 1 | GLL |
| 2 | GSA |
| 3 | GSV |
| 4 | RMC |
| 5 | VTG |
| 6 | MSS (If internal beacon is supported) |
| 7 | Not defined |
| 8 | ZDA (if 1PPS output is supported) |
| 9 | Not defined |

Table 12: NMEA Messages

Note: Please consider max transfer rate (depending on baud rate setting) before activating additional NMEA sentences.

Note: In TricklePower mode, update rate is specified by the user. When switching to NMEA protocol, the message update rate is also required. The resulting update rate is the product of the TricklePower update rate and the NMEA update rate (i.e., TricklePower update rate = 2 seconds, NMEA update rate = 5 seconds, resulting update rate is every 10 seconds, (2 x 5 = 10)).

3.6 Development Data On/Off

Use this command to enable development data information if you are having trouble getting commands accepted. Invalid commands generate debug information that enables you to determine the source of the command rejection. Common reasons for input command rejection are invalid checksum or parameter out of specified range.

Table 13 contains the input values for the following examples:

1. Debug On

- \$PSRF105,1*3E

2. Debug Off

- \$PSRF105,0*3F

| Name | Example | Description |
|------------|-----------|----------------------------|
| Message ID | \$PSRF105 | PSRF105 protocol header |
| Debug | 1 | 0 Off 1 On |
| Checksum | *3E | End of message termination |

Table 13: Development Data On/Off Data Format

3.7 Select Datum

All GSC3-based GPS modules perform initial position and velocity calculations using an earth-centered earth-fixed (ECEF) coordinate system. Results may be converted to an earth model (geoid) defined by the selected datum. The default datum is WGS84 (World Geodetic System 1984) which provides a worldwide common grid system that may be translated into local coordinate systems or map datums. Local map datums are a best fit to the local shape of the earth and not valid worldwide.

The table below contains the input values for the following examples:

Datum select TOKYO_MEAN

- \$PSRF106,178*32

| Name | Example | Description |
|------------|-----------|---|
| Message ID | \$PSRF106 | PSRF106 protocol header |
| Datum | 178 | 21=WGS84 178=TOKYO_MEAN 179=TOKYO_JAPAN 180=TOKYO_KOREA 181=TOKYO_OKINAWA |
| Checksum | *32 | End of message termination |

Table 14: Select Datum Data Format

3.8 Shut-Down Module

All GSD4e-based GPS modules will enter hibernate mode after this command has been issued. Data in SRAM are being maintained, the RTC will keep on running.

- \$PSRF117,16*0B

| Name | Example | Description |
|------------|-----------|----------------------------|
| Message ID | \$PSRF117 | PSRF117 protocol header |
| Shutdown | 16 | Shutdown command |
| Checksum | *0B | End of message termination |

Table 15: Shut-down command

To wake up the GPS module again toggling the ON_OFF pin is necessary.

4 NMEA and Binary mode

By default the GSD4e-based modules start off in NMEA mode. The information that can be derived is somehow limited. Also, special functionality of the GSD4e can only be accessed using OSP or SiRF Binary Protocol. This chapter shall give an overview on how to switch between NMEA mode and OSP / SiRF Binary Protocol.

4.1 From NMEA to Binary Mode

This is done using the following NMEA command (note that the baud rate can be different):

- \$PSRF100,0,57600,8,1,0*37

Here is a more general description on the PSRF100 command that allows switching to SiRF binary protocol:

| Name | Example | Description |
|------------|-----------|---|
| Message ID | \$PSRF100 | PSRF100 protocol header |
| Protocol | 0 | 0 SiRF binary |
| Baud | 9600 | 4800, 9600, 19200, 38400, 57600, 115200 |
| DataBits | 8 | 8 |
| StopBits | 1 | 1 |
| Parity | 0 | 0 none |
| Checksum | *0C | End of message termination |

Table 16: Command to switch to SiRF binary protocol

After that information from the module and commands to the module are transmitted in SiRF Binary Protocol mode. For details please refer to the according manual.

This command has no impact on the serial port used. All data exchange will be done via port 0.

As long as the module is powered (Vcc supplied), the module will store the configuration and reboot after a reset in the very same way. If completely powered off, the module will start in default NMEA mode again.

4.2 From Binary to NMEA Mode

When you configured the module you might wish to go back to NMEA mode in order to get the PVT information in the standard, familiar way. In order to do that, you can use the following binary command sequence:

A0A200188102010100010101010101010001000100010001000112C00163B0B3

Within this message one can determine the following segments (this applies generally to all SiRF binary commands):

- A0A20018 — Start Sequence (A0A2) and Payload Length (0x18 = 24)
- 8102010100010101010101010001000100010001000112C0 — Payload
- 0163B0B3 — Message Checksum (0163) and End Sequence (B0B3)

| Name | Bytes | Example | Unit | Description |
|----------------------------------|-------|---------------|------|--|
| Message ID | 1 U | 0x81 | | Decimal 129 |
| Mode | 1 U | 0x02 | | Do not change last-set value for NMEA debug |
| <u>GGA Message</u> ¹⁾ | 1 U | <u>0x01</u> | sec | See NMEA Protocol Reference Manual for format |
| Checksum ²⁾ | 1 U | <u>0x01</u> | | Send checksum with GGA message |
| <u>GLL Message</u> | 1 U | <u>0x00</u> | sec | See NMEA Protocol Reference Manual for format |
| Checksum | 1 U | <u>0x01</u> | | |
| <u>GSA Message</u> | 1 U | <u>0x01</u> | sec | See NMEA Protocol Reference Manual for format |
| Checksum | 1 U | <u>0x01</u> | | |
| <u>GSV Message</u> | 1 U | <u>0x01</u> | sec | See NMEA Protocol Reference Manual for format |
| Checksum | 1 U | <u>0x01</u> | | |
| <u>RMC Message</u> | 1 U | <u>0x01</u> | sec | See NMEA Protocol Reference Manual for format |
| Checksum | 1 U | <u>0x01</u> | | |
| <u>VTG Message</u> | 1 U | <u>0x00</u> | sec | See NMEA Protocol Reference Manual for format |
| Checksum | 1 U | <u>0x01</u> | | |
| <u>MSS Message</u> | 1 U | <u>0x00</u> | sec | Output rate for MSS message (always zero, as not supported here) |
| Checksum | 1 U | <u>0x01</u> | | |
| Unused field ³⁾ | 1 U | 0x00 | | |
| Unused field ³⁾ | 1 U | 0x01 | | |
| <u>ZDA Message</u> | 1 U | <u>0x00</u> | sec | See NMEA Protocol Reference Manual for format |
| Checksum | 1 U | <u>0x01</u> | | |
| Unused field ³⁾ | 1 U | 0x00 | | |
| Unused field ³⁾ | 1 U | 0x01 | | |
| <u>Bit rate</u> | 2 U | <u>0x12C0</u> | | 1200, 2400, <u>4800</u> , 9600, 19200, 38400, and 57600 |

Table 17: Switch to NMEA mode – Message ID 129

- 1) A value of 0x00 implies not to send message, otherwise data is sent at 1 message every X seconds requested (e.g., to request a message to be sent every 5 seconds, request the message using a value of 0x05). Maximum rate is 1/255 sec.
- 2) A value of 0x00 implies the checksum is not transmitted with the message (not recommended). A value of 0x01 has a checksum calculated and transmitted as part of the message (recommended).
- 3) These fields are available if additional messages have been implemented in the NMEA protocol.

So this command would result in switching to NMEA mode with a baud rate of 4800 bits per second and the following configuration:

GGA – ON at 1 sec, GLL – OFF, GSA – ON at 1sec, GSV – ON at 1 sec, RMC – ON at 1sec, VTG - OFF, MSS – OFF, ZDA - OFF.

After that information from the module and commands to the module are transmitted in NMEA format again.

5 Important Binary Commands

5.1 Static Mode

Static navigation is a position filter designed to be used with applications intended for motor vehicles. When the vehicle's speed falls below a threshold, the position and heading are frozen, and speed is set to zero. This condition continues until the computed speed rises above 1.2 times the threshold or until the computed position is at least a set distance from the frozen place. The threshold speed and set distance may vary with software versions, currently the thresholds are as follows:

- Speed: ~ 3km/h
- Position: ~ 50m

These thresholds are fixed and cannot be modified by the user. Also, with the static mode one cannot reach a higher accuracy! But one will avoid small jumps due to the “noise” in the GPS signals and receiver.

To initialize static mode it is necessary to send the message with ID 143 to the receiver – which has to be put into binary mode before.

```
A0A200028F010090B0B3
```

Within this message one can determine the following segments:

- A0A20002 — Start Sequence (A0A2) and Payload Length (0x02 = 2)
- 8F01 — Payload
- 0090B0B3 — Message Checksum (0090) and End Sequence (B0B3)

| Name | Bytes | Scale | Example | Unit | Description |
|-------------------------------|-------|-------|-------------|------|----------------------------------|
| Message ID | 1 U | | 0x8F | | Decimal 143 |
| <u>Static Navigation Flag</u> | 1 U | | <u>0x01</u> | | 0 = Enable (here) 1 = Disable |

Table 18: Static Navigation enable – Message ID 143

To disable static mode, the according command would be:

```
A0A200028F00008FB0B3
```

Within this message one can determine the following segments:

- A0A20002 — Start Sequence (A0A2) and Payload Length (0x02 = 2)
- 8F00 — Payload
- 008FB0B3 — Message Checksum (008F) and End Sequence (B0B3)

| Name | Bytes | Scale | Example | Unit | Description |
|-------------------------------|-------|-------|-------------|------|----------------------------------|
| Message ID | 1 U | | 0x8F | | Decimal 143 |
| <u>Static Navigation Flag</u> | 1 U | | <u>0x00</u> | | 0 = Enable 1 = Disable (here) |

Table 19: Static Navigation disable – Message ID 143

5.2 SBAS Support

The GSD4e chip set supports the Satellite Based Augmentation System SBAS – a kind of Differential GPS (DGPS) via satellite. The advantage of SBAS towards traditional DGPS lies in the fact that correctional data are received on a normal GPS channel. Therefore the receiver can use one of its 48 channels to detect and decode SBAS information. There is no need for an additional external receiver.

To initialize SBAS mode it is necessary to send the message with ID 133 (DGPS source) to the receiver – which has to be put into binary mode before.

A0A200078501000000000000086B0B3

Within this message one can determine the following segments:

- A0A20007 — Start Sequence (A0A2) and Payload Length (0x07 = 7)
- 85010000000000 — Payload
- 0086B0B3 — Message Checksum (0086) and End Sequence (B0B3)

| Name | Bytes | Scale | Example | Unit | Description |
|----------------------------------|-------|-------|-------------------|------|---|
| Message ID | 1 U | | 0x85 | | Decimal 133 |
| <u>DGPS Source</u> | 1 U | | <u>0x01</u> | | 0 = None 1 = SBAS (here) 2 = External RTCM data 3 = Internal DGPS beacon receiver 4 = User software |
| <u>Internal beacon frequency</u> | 4 U | | <u>0x00000000</u> | | Not used! |
| <u>Internal beacon bit rate</u> | 1 U | | <u>0x00</u> | | Not used! |

Table 20: DGPS source selection – Message ID 133

By default the receiver will find the right SBAS satellite automatically. One can select a specific SBAS satellite using message ID 170. Please refer to the SiRF Binary Reference Manual for details.

5.3 SiRFaware™ Mode

SiRFaware™ is a low-power operating mode that seeks to maintain low uncertainty in position, time, and frequency, and to maintain valid current Ephemeris using either data collected from satellites in view or Extended Ephemeris methods.

To enter SiRFaware™ mode it is necessary to send the message with ID 218 to the receiver.

A0A20006DA020000000000DCB0B3

Within this message one can determine the following segments:

- A0A20006 — Start Sequence (A0A2) and Payload Length (0x06 = 6)
- DA0200000000 — Payload
- 00DCB0B3 — Message Checksum (00DC) and End Sequence (B0B3)

| Name | Bytes | Scale | Example | Unit | Description |
|-----------------|-------|-------|-------------------|------|--|
| Message ID | 1 U | | 0xDA | | Decimal 218 |
| <u>SubID</u> | 1 U | | <u>0x02</u> | | 0 = Full Power Mode 1 = Advanced Power Management Mode 2 = SiRFaware™ Mode (MPM) 3 = Trickle Power Mode 4 = PTF Mode |
| <u>Reserved</u> | 4 U | | <u>0x00000000</u> | | Not used with SubID 2! |

Table 21: Entering SiRFaware™ mode – Message ID 218

To exit from SiRFaware™ mode and get a fix instantaneously it is necessary to toggle the of ON_OFF pin.

5.4 Shut-Down Module

All GSD4e-based GPS modules will enter hibernate mode after this command has been issued. Data in SRAM are being maintained, the RTC will keep on running. When the module is in OSP / SiRF Binary mode the command with ID 205 must be sent:

A0A20002CD1000DDB0B3

Within this message one can determine the following segments:

- A0A20002 — Start Sequence (A0A2) and Payload Length (0x02 = 2)
- CD10 — Payload
- 00DDB0B3 — Message Checksum (00DD) and End Sequence (B0B3)

| Name | Bytes | Scale | Example | Unit | Description |
|--------------|-------|-------|-------------|------|-----------------------------|
| Message ID | 1 U | | 0xCD | | Decimal 205 |
| <u>SubID</u> | 1 U | | <u>0x10</u> | | 0x10 Software commanded off |

Table 22: Shut-down command

To wake up the GPS module again toggling the ON_OFF pin is necessary.
