SIM5360_Hardware Design_V1.06

Document Title	SIM5360 Hardware Design
Version	1.06
Date	2016-11-17
Status	Release
Document Control ID	SIM5360_Hardware Design_V1.06

General Notes

SIMCom offers this information as a service to its customers, to support application and engineering efforts that use the products designed by SIMCom. The information provided is based upon requirements specifically provided to SIMCom by the customers. SIMCom has not undertaken any independent search for additional relevant information, including any information that may be in the customer's possession. Furthermore, system validation of this product designed by SIMCom within a larger electronic system remains the responsibility of the customer or the customer's system integrator. All specifications supplied herein are subject to change.

1   Introduction

This document describes electronic specifications, RF specifications, function interface, mechanical characteristic and testing conclusions of the SIMCom SIM5360 module. With the help of this document and other SIM5360 software application notes, user guides, users can quickly understand and use SIM5360 module to design and develop applications quickly.

1.1   Product Outline

Designed for global market, SIM5360 is a quad-band GSM/GPRS/EDGE and dual-band UMTS /HSPA+ that works on frequencies of GSM 850MHz, EGSM 900 MHz, DCS 1800 MHz, PCS 1900MHz and WCDMA 2100/900MHz, 1900/850 MHz, 2100/850 MHz. User can choose the module based on the wireless network configuration. In this document, the entire radio band configuration of SIM5360 series is described in the following table.

Table 1: SIM5360 series frequency bands

Standard	Frequency	SIM5360J	SIM5360E	SIM5360A
GSM	GSM 850MHz	✓	✓	✓
	EGSM 900MHz	✓	✓	✓
	DCS1800MHz	✓	✓	✓
	PCS1900MHz	✓	✓	✓
WCDMA	WCDMA 850MHz	✓		✓
	WCDMA 900MHz		✓	
	WCDMA 1900MHz			✓
	WCDMA 2100MHz	✓	✓	
HSPA	HSDPA	✓	✓	✓
	HSUPA	✓	✓	✓
GNSS	GPS	✓	✓	✓
	GLONASS	✓	✓	✓

With a tiny configuration of 30*30*2.9 mm and integrated functions, SIM5360 can meet almost any space requirement in users' application, such as Smart phone, PDA phone, industrial handhelds, machine-to-machine, vehicle applications, etc..

There are 82 pins on SIM5360, which provide most application interfaces for customers' board.

1.2   Hardware Interface Overview

Sub-interfaces are described in detail in the next chapter, which includes:
● **Power Supply**
● **USB Interface**
● **UART Interface**
● **SD card Interfaces**
● **USIM Interface**
● **GPIO**
● **ADC**
● **LDO Power Output**
● **Current Sink Source**
● **PCM Interface**
● **Keypad Interface**
● **SPI Interface**
● **RTC**
● **I2C Interface**

1.3   Hardware Diagram

The global architecture of the SIM5360 Embedded module is described in the figure below.
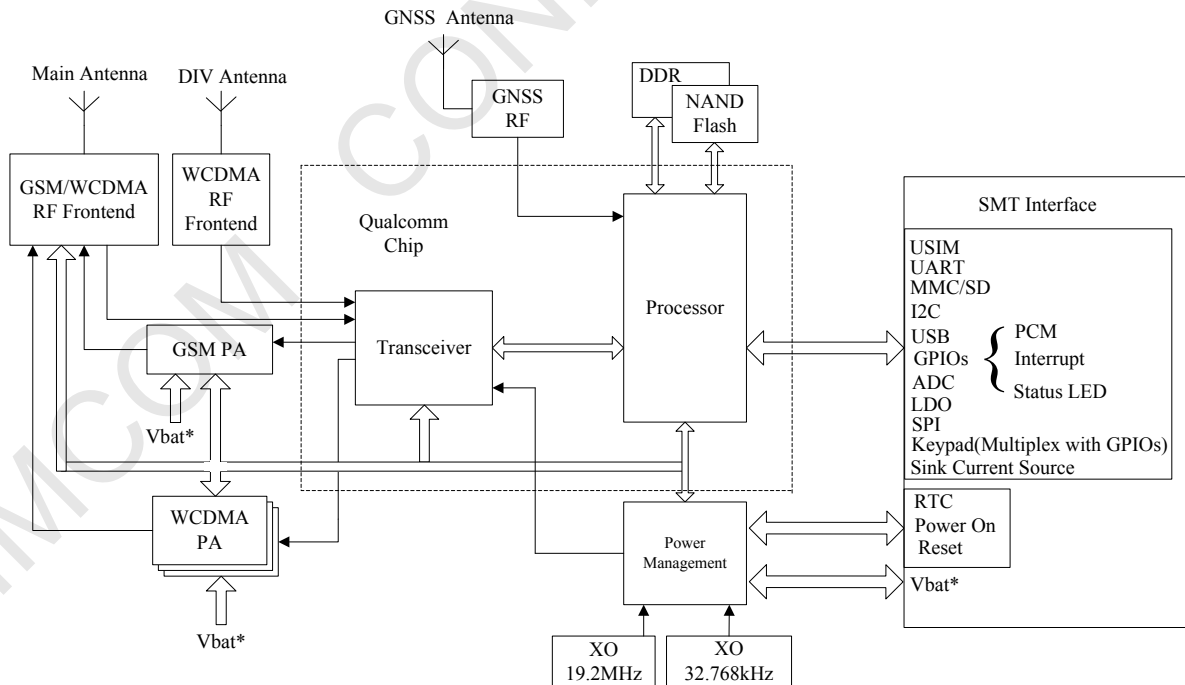

Figure 1: SIM5360 functional architecture

1.4   Functional Overview

Table 2: General Feature

Feature	Implementation
Power supply	Single supply voltage 3.4～4.2V
Transmission data	● Dual-mode UMTS/HSPA+/EDGE/GPRS operation ● GPRS Class B, multislot class 12 operation, Supports coding scheme: CS1-4 ● EDGE multislot class 12 operation, Supports coding schemes MSC1-9 ● UMTS R99 data rates-384 kbps DL/UL ● Category 6 HSDPA -14.4 Mbps HSUPA-5.76 Mbps ● CSD feature: 9.6, 14.4, 64 kbps UL/DL
GNSS	● GNSS engine (GPS and GLONASS) ● Protocol: NMEA ● Mobile-assisted mode ● Mobile-based mode ● Standalone mode
SMS	● MT, MO, CB, Text and PDU mode ● SMS storage: SIM card or ME(default) ● Support transmission of SMS alternatively over CSD or GPRS. User can choose preferred mode.
USIM interface	Support identity card: 1.8V, 3V.
Audio features(optional)	Support digital audio interface: PCM interface. Speech codec modes: ● GSM : HR/FR/EFR/AMR ● WCDMA : AMR ● Echo cancellation and noise suppression.
UART interface	● Support full mode or null mode ● Support AT command
USB	Support USB2.0 Slave mode
Rx-diversity	Support UMTS Rx-diversity.
Phonebook management	Support phonebook types: SM, FD, LD, RC, ON, MC.
USIM application toolkit	Support SAT class 3, GSM 11.14 Release 98 Support USAT
Real Time Clock	Support RTC
Physical characteristics	Size:30*30*2.9mm Weight:5.7 g
Firmware upgrade	Firmware upgrade over USB interface
PCM	Multiplex on GPIOs. Used for analog audio function with external codec. Support long frame sync and short frame sync. Support 8-bit A-law, μ-law and 16-bit linear data formats. Support master and slave mode, but must be the master in long frame sync.

Temperature range	● Normal operation temperature: -30°C to +80°C
	● Extended operation temperature: -40°C to +85°C
	● Storage temperature -45°C to +90°C

2 Package Information

2.1 Pin Configuration

All hardware interfaces which connect SIM5360 to customers' application platform are through 82 pins pads (Metal half hole). Figure 2 is SIM5360 outline diagram.

Figure 2: Pin view

Table 3: Pin definition

Pin No.	Define	Pin No.	Define
1	GND	2	GND

Table 4: IO Parameters Definition

Pin Type	Description
PI	Power input
PO	Power output
IO	Bidirectional input / output
DI	Digital input
DO	Digital output
AI	Analog input

Table 5: Pin description

Pin name	Pin No.	I/O	Description	Comment
Power Supply				
VBAT	38,39, 62,63	PI	Power supply voltage	
VRTC	42	I/O	Power supply for RTC	
VDD_EXT	44	PO	LDO power output for SD card circuit or other external circuit. This LDO output voltage can be changed by the AT command "AT+CVAUXV".	If it is unused, keep open.
VDD_1V8	15	PO	The 1.8V SMPS output for external circuit, such as level shift circuit.	
GND	1,2,5,10,14,37,40,41,43,57,58,60,61,64,65,77,78,80,81		Ground	

Power on/off				
PWRKEY	3	DI	PWRKEY should be pulled low at least 180ms to power on or 500ms to power off the module.	
SD interface				
SD_CMD	21	I/O	SDIO command	
SD_DATA0	22	I/O	SDIO data	
SD_DATA1	23	I/O	SDIO data	If it is unused, keep open.
SD_DATA2	24	I/O	SDIO data	
SD_DATA3	25	I/O	SDIO data	
SD_CLK	26	DO	SDIO clock	
USIM interface				
USIM_DATA	17	I/O	SIM Data Output/Input	
USIM_RST	18	DO	SIM Reset	All signals of SIM interface should be protected against ESD/EMC.
USIM_CLK	19	DO	SIM Clock	
USIM_VDD	20	PO	Voltage Supply for SIM card Support 1.8V or 3V SIM card	
SPI/UART2 interface				
SPI_CLK	6	DO	SPI clock	
UART2_RXD /SPI_MISO	7	DI	Receive data of UART2 / SPI (master only) master in/slave out data	If it is unused, keep open.
UART2_TXD / SPI_MOSI	8	DO	Transmit data of UART2 / SPI (master only) master out/slave in data	
SPI_CS	9	DO	SPI chip-select	
USB				
USB_VBUS	11	PI	USB power supply input	They are compliant with the USB 2.0 specification.
USB_DN	12	I/O	Negative line of the differential, bi-directional USB signal to/from the	
USB_DP	13	I/O	Positive line of the differential, bi-directional USB signal to/from the	If it is unused, keep open.
UART1 interface				
RTS	66	DO	Request to send	
CTS	67	DI	Clear to Send	RXD has been pulled down with a 12kR resistor to ground in the module. If it is unused, keep open.
RXD	68	DI	Receive Data	
RI	69	DO	Ring Indicator	
DCD	70	DO	Carrier detects	
TXD	71	DO	Transmit Data	
DTR	72	DI	DTE get ready	

I2C interface				
SCL	55	DO	I2C clock output	None pulled up resistors in the module. Pulled up with a 2.2kR resistor to 1.8V externally. . If it is unused, keep open.
SDA	56	I/O	I2C data	
Keypad interface				
KBR0	29	DO	Bit 0 drive to the pad matrix	All Keypad pins can be configured as GPIOs. If it is unused, keep open.
KBR1	33	DO	Bit 1 drive to the pad matrix	
KBR2	30	DO	Bit 2 drive to the pad matrix	
KBR3	35	DO	Bit 3 drive to the pad matrix	
KBR4	34	DO	Bit 4 drive to the pad matrix	
KBC0	28	DI	Bit 0 for sensing key press on pad matrix	
KBC1	27	DI	Bit 1 for sensing key press on pad matrix	
KBC2	31	DI	Bit 2 for sensing key press on pad matrix	
KBC3	32	DI	Bit 3 for sensing key press on pad matrix	
KBC4	36	DI	Bit 4 for sensing key press on pad matrix	
PCM interface				
PCM_OUT/GPIO5	73	DO	PCM data output. It also can be multiplexed as GPIO5.	If it is unused, keep open.
PCM_IN/GPIO0	74	DI	PCM data input. It also can be multiplexed as GPIO0 with module wake/interrupt.	
PCM_SYNC/GPIO2	75	DO	PCM data frame sync signal. It also can be multiplexed as GPIO2.	
PCM_CLK/GPIO3	76	DO	PCM data bit clock. It also can be multiplexed as GPIO3.	
GPIOs				
NETLIGHT/GPIO1	51	DO	Output PIN as LED control for network status.	If it is unused, keep open.
GPIO4	54	DI	Input PIN as RF operating control.	
GPIO40	49	DO	Output PIN as operating status indicating of module.	
GPIO41	52	DO	General input/output PIN. It can be used as wake/interrupt signal to host from module	
GPIO43	50	DI	General input/output PIN. It can	

			be used as wake/interrupt signal to module from host.	
GPIO44	48	I/O	General input/output PIN.	
GPIO42	53	I/O	General input/output PIN.	
RF interface				
MAIN _ANT	59		MAIN ANT soldering pad	
GNSS_ANT	79	AI	GNSS ANT soldering pad	
AUX_ANT	82	AI	Diversity ANT soldering pad	
Other interface				
RESET	4	DI	System reset in, active low.	
ISINK	45	DI	Current source of ground-referenced current sink	Refer to 3.13.1
ADC1	47	AI	Analog Digital Converter Input	Refer to 3.13.3
ADC2	46	AI	Analog Digital Converter Input	
RESERVED	16		Reserved	

2.3   Package Dimensions

The following figure shows mechanical dimensions of SIM5360.
Figure 3: Top dimensions (Unit: mm)
Figure 4: Side dimensions (Unit: mm)
Figure 5: Bottom dimensions (Unit: mm)

2.4   Footprint Recommendation
Figure 6: Footprint recommendation (Unit: mm)

3   Application Interface Specification

3.1   Power Supply

The power supply pins of SIM5360 include four VBAT pins (pin 62&63, pin 38&39). VBAT directly supplies the power to RF circuit and baseband circuit. All four VBAT pins of SIM5360 must be used together. VBAT directly supplies the power to RF PA and baseband system. For the VBAT, the ripple due to GSM/GPRS emission burst (every 4.615ms）may cause voltage drop, and the current consumption rises typically to peak of 2A. So the power supply must be able to provide sufficient current up to more than 2A. The following figure is the VBAT voltage ripple wave at the maximum power transmit phase.

The test condition: VBAT =4.0V, VBAT maximum output current =2A, C_A=100 µF tantalum capacitor (ESR=0.7Ω) and C_B=1µF(Please refer to Figure 8―Application circuit).
Figure 7: VBAT voltage drop during burst emission (GSM/GPRS)

3.1.1   Power Supply Pin

Four VBAT pins are dedicated to connect the supply voltage.

Table 6: Pin description

Pin type	Pin name	Min	Typ	Max	Unit
POWER	VBAT	3.4	3.8	4.2	V

3.1.2   Design Guide

Make sure that the input voltage at the VBAT pin will never drop below 3.3V even during a transmit burst when the current consumption rises up to more than 2A. If the power voltage drops below 3.3V, the module may be shut down automatically. Using large tantalum capacitors (above 100uF) will be the best way to reduce the voltage drops. If the power current cannot support up to 2A, users must introduce larger capacitor (typical 1000uF) to storage electric power, especially GPRS multiple time slots emission.

For the consideration of RF performance and system stability, some multi-layer ceramic chip (MLCC) capacitors (0.1/1uF) need to be used for EMC because of their low ESR in high frequencies. Note that capacitors should be put beside VBAT pins as close as possible. Also User should minimize the PCB trace impedance from the power supply to the VBAT pins through widening the trace to 80 mil or more on the board. The following figure is the recommended circuit.

In addition, in order to get a stable power source, it is suggested to use a zener diode of which reverse zener voltage is 5.1V and dissipation power is more than 500mW.

Table 7: Recommended zener diode models

No.	Manufacturer	Part Number	Power	Package
1	On semi	MMSZ5231BT1G	500mW	SOD123
2	Prisemi	PZ3D4V2H	500mW	SOD323
3	Vishay	MMSZ4689-V	500mW	SOD123
4	Crownpo	CDZ55C5V1SM	500mW	0805
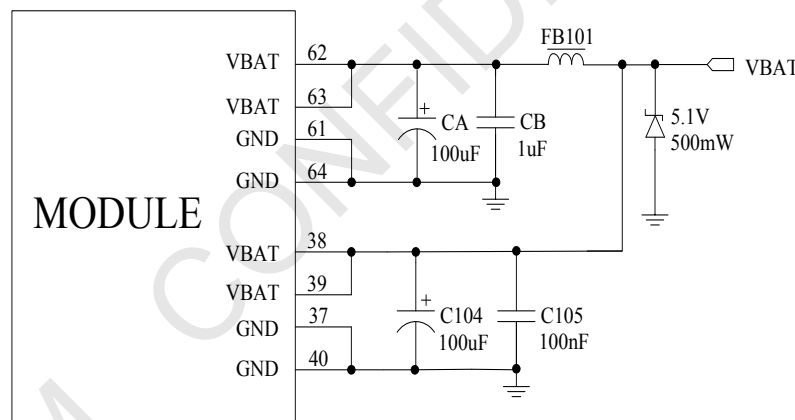

Figure 8: VBAT input application circuit

There are three sections about how to design and optimize users' power systems.

Power supply circuit

SIMCom recommend DCDC or LDO is used for the power supply of the module, make sure that the peak current of power components can rise up to more than 2A. The following figure is the reference design of +5V input power supply. The designed output for the power supply is 3.8V, here a linear regulator can be used.
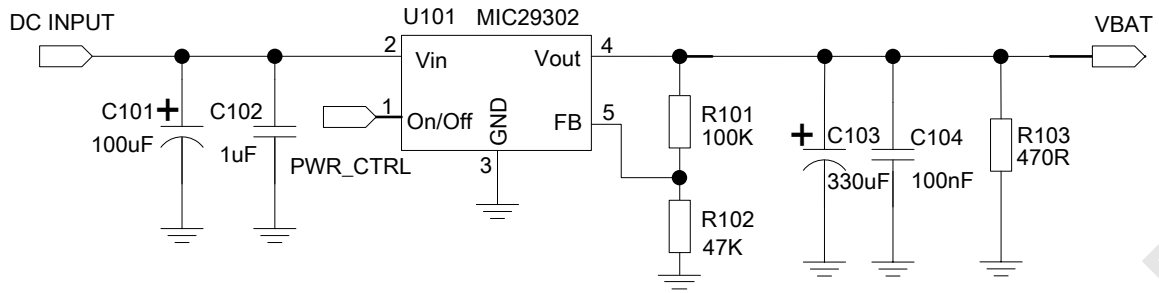

Figure 9: Reference circuit of the LDO power supply

If there is a big difference between the input voltage and the desired output (VBAT), a switching converter power will be preferable because of its better efficiency, especially at the high current situation. The following figure is the reference circuit. Note that DCDC may deprave RF performance because of ripple current intrinsically.
Figure 10: Reference circuit of the DCDC power supply

Voltage monitor

To monitor the power supply voltage, user can use the AT command "AT+CBC", this command has two parameters: the battery status and the voltage value (mV). It will return the capacity percentage and actual value of battery (at the VBAT pin). The voltage is continuously measured at intervals, whenever the measured battery voltage is lower than a specific value set by the AT command "AT+CVALARM". For example, if the voltage value is set to be 3.4V, the following URC will be presented: "warning! voltage is low: 3.3v".

If the voltage is lower than a specific value which is set by the AT command "AT+CPMVT", the module will be powered off automatically and AT commands cannot be executed any more.

Note: Under-voltage warning function is disabled by default, user can enable it by the AT command "AT+CVALARM". Please refer to Document [1].

3.1.3   RTC Backup

The module uses RTC (Real Time Clock) to update and maintain inherent time at no VBAT power supply status. The RTC power supply of module can be provided by an external capacitor or a battery (non-chargeable or rechargeable) through the VRTC. The following figures show various reference circuits for RTC back up. The discharge current is less than 10uA.

● **External capacitor backup**
Figure 11: RTC supply from capacitor

● **Non-chargeable battery backup**
Figure 12: RTC supply from non-chargeable battery

● **Rechargeable battery backup**
Figure 13: RTC supply from rechargeable battery

Coin-type rechargeable battery is recommended, such as ML414H-IV01E form Seiko can be used.

Note: The VRTC can be disabled, jus disconnect it in application circuit.

3.2 Reset Function

SIM5360 also have a RESET pin (PIN4) to reset the module. This function is used as an emergency reset only when AT command "AT+CPOF" and the PWRKEY pin has no effect. User can pull the RESET pin to ground, then the module will reset.

This pin is already pulled up in module, so the external pull-up resistor is not necessary. A 100nF capacitor close to the RESET pin is strongly recommended. A reference circuit is recommended in the following figure.
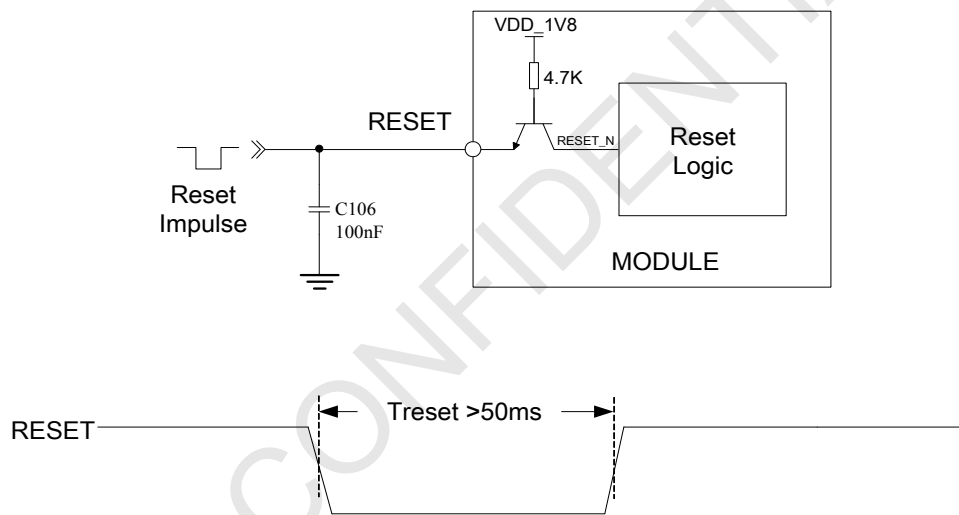

Figure 14: Reset circuit

Note：50ms<Treset<200ms. ESD components are suggested to be used on Reset pin.

3.3 Minimize Power Consumption

There are two modes that SIM5360 achieves low power consumption.

3.3.1 Sleep mode

If peripheral equipments stops working, and there is no on air or hardware interrupts (such as GPIO interrupts or data on UART), SIM5360 will enter sleep mode automatically. In this mode, SIM5360 can still receive paging，voice call or SMS from network.

Sleep mode Design guide

● Using USB interface

SIM5360 USB interface is connected with a host CPU. SIM5360 could enter sleep mode when the host CPU supports USB suspend mode, otherwise it could not enter sleep mode.

If host CPU don't support USB suspend mode, the SIM5360 module can enter sleep mode by cutting off USB_VBUS line.

NOTE: Please reference Document[24] for detailed.

● Using UART interface

SIM5360 UART interface is connected with a host CPU. Host device can use module DTR as an indicator to let SIM5360 enter into sleep mode or wakeup from sleep mode.

    The module will ready to enter into sleep mode if DTR pin is pulled up.
    The module will ready to exit from sleep mode if DTR pin is pulled down.

Wake up Design guide

SIM5360 can be waked up via pulling module GPIO43 or DTR low level by host cpu .

● Waked up automatically

SIM5360 can exit from sleep mode automatically when the following events are happened:

  ➢ SMS received
  ➢ Incoming call happened

● Waked up manually

SIM5360 can exit from sleep mode manually when the following events are happened:

  ➢ UART event
  The DTR is low level.

  ➢ USB event
  ➢ GPIOx Interrupt

NOTE: Please reference Document[25] for detailed.

Minimum functionality mode

Minimum functionality mode ceases a majority function of module, thus minimizing the power consumption. This mode is set by the AT command which provides a choice of the functionality levels.

● AT+CFUN=0: Minimum functionality

● AT+CFUN=1: Full functionality (Default)

● AT+CFUN=4: Disable RF function of the module (Flight mode)

Table 8: The Current Consumption of Minimum Functionality Mode (BS-PA-MFRMS=5)

<fun>	Current consumption(mA) (sleep mode)
0	1.3
1	1.5
4	1.3

If SIM5360 has been set to minimum functionality mode, the module will firstly enter sleep mode, then the RF function and SIM card function will be closed. In this case, the serial port is still accessible, but RF function or SIM card will be unavailable. When SIM5360 is in minimum functionality or flight mode, it can return to full functionality by the AT command "AT+CFUN=1".

Note: For flight mode, please refer to Chapter 3.10.2.

3.4   Power on/off Time Sequence

3.4.1   Power on Sequence

SIM5360 can be powered on by PWRKEY pin, which starts normal operating mode.
PWRKEY pin is pulled up with a 200k ohm resistor to 1.8V in module. User can power on the SIM5360 by pulling the PWRKEY pin down for a short time. The power-on scenarios are illustrated in the following figures.
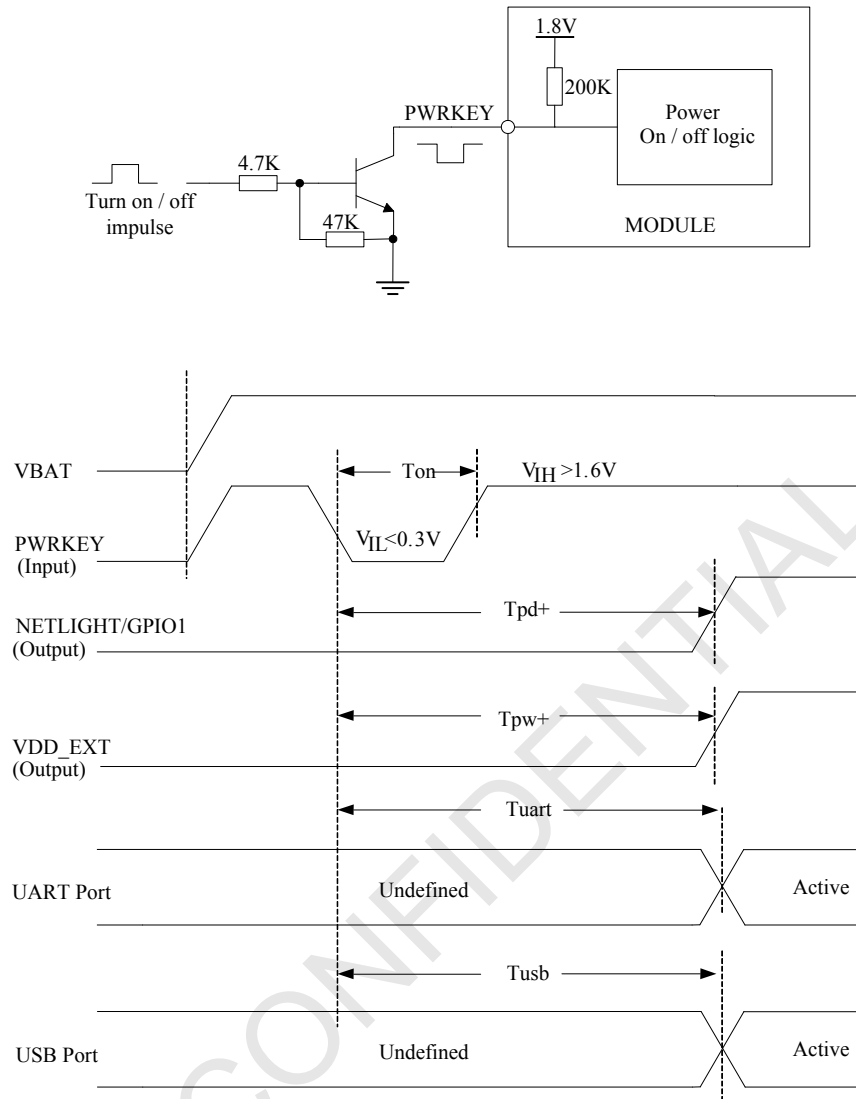

Figure 15: Power on Timing Sequence

Table 9: Power on timing

Symbol	Parameter	Time value			Unit
		Min.	Typ.	Max.	
Ton	The time to pull PWRKEY down to power on	180	500	-	ms
TpD+	The time to indicate connecting with the network	-	-	5	s
Tpw+	The time to indicate the module is powered on completely	-	-	0.5	s
Tuart	The time to enable UART	-	-	8	s
Tusb	The time to enable USB	-	-	10	s

Note: Module could be automatically power on by connecting PWRKEY pin to Low level directly.

Before designing, please refer to Document [27] for more detail.

3.4.2   Power off Sequence

The following methods can be used to power off SIM5360. These procedures will make module disconnect from the network and allow the software to enter a safe state, and then save data before completely powering the module off.

● Method 1: Power off SIM5360 by pulling the PWRKEY pin down
● Method 2: Power off SIM5360 by AT command

User can power off the SIM5360 by pulling PWRKEY down for a specific time. The power off scenario is illustrated in the following figure.
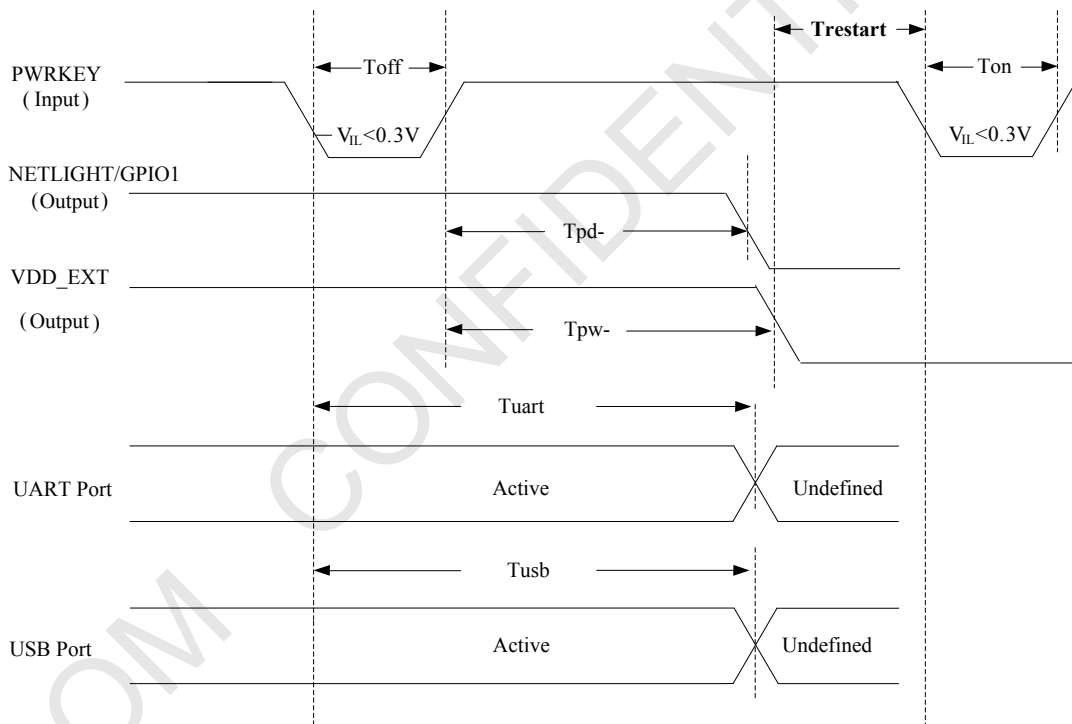

Figure 16: Power off timing sequence

Table 10: Power off timing

Symbol	Parameter	Time value			
		Min.	Typ.	Max.	Unit
Toff	The time pulling PWRKEY down to power off	0.5	-	5	s
TpD-	The time to indicate disconnecting from the network	-	-	2	s

Tpw-	The time to indicate the module power off completely	-	-	2	s
Tuart	The time to disable UART	-	-	3	s
Tusb	The time to disable USB	-	-	2	s
Trestart	The time to power on again after Tpw-	0	-	-	s

User can also use the AT command "AT+CPOF" to power down the module. After that, the AT commands cannot be executed any longer. The module enters the POWER DOWN mode, only the RTC is still active. For details, refer to *Document [1]*.

3.5   UART Interface

SIM5360 provides two UARTs (universal asynchronous serial transmission) port. UART1 consists of a flexible 7-wire serial interface. UART2 consists of 2-wire serial interface. The module is as the DCE (Data Communication Equipment) and the client PC is as the DTE (Data Terminal Equipment). AT commands are entered and serial communication is performed through UART interface.
In order to prevent the UART signals of the module damaged due to voltage spikes or ESD, series resistors can be used on UART signals.

The application circuit is in the following figures.
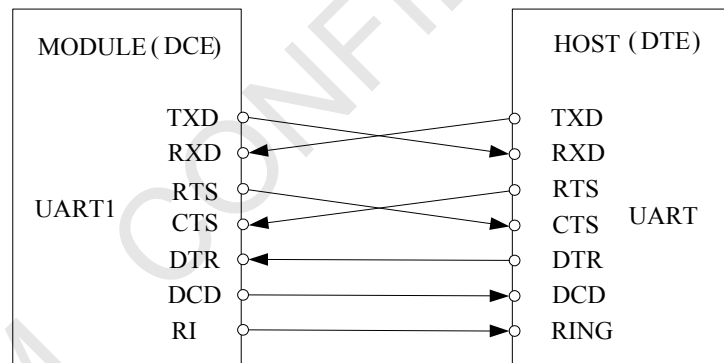

Figure 17: UART1 Full modem
Figure 18: Null modem (UART1 and UART2)

3.5.1   Pin Description

Table 11: Pin description

Pin type	Pin name	Pin No.	I/O	Default Status
UART1	RXD	68	I	Pull-Down
	TXD	71	O	Pull-Up
	RTS	66	O	Pull-Up
	CTS	67	I	Pull-Down
	DTR	72	I	Pull-Up
	DCD	70	O	Pull-Up
	RI	69	O	Pull-Up
UART2	UART2_RXD	7	I	Pull-Down
	UART2_TXD	8	O	Pull-Up

More pin information refers to chapter 2.2.

Table 12: Logic level

Symbol	Parameter	Min	Typ	Max	Unit
V_{IH}	High-level input voltage	1.26	1.8	2.1	V
V_{IL}	Low-level input voltage	-0.3	0	0.63	V
V_{OH}	High-level output voltage	1.35	-	1.8	V
V_{OL}	Low-level output voltage	0	0	0.45	V

3.5.2 Application Guide

If UART port is used in Null Modem, the pin "RI" can be used as an interrupt signal to HOST. Normally it will keep high logic level until certain condition such as receiving SMS, voice call (CSD, video) or URC reporting, then "RI" will change to low logic level to inform the master (client PC). It will stay low until the master clears the interrupt event with AT command.
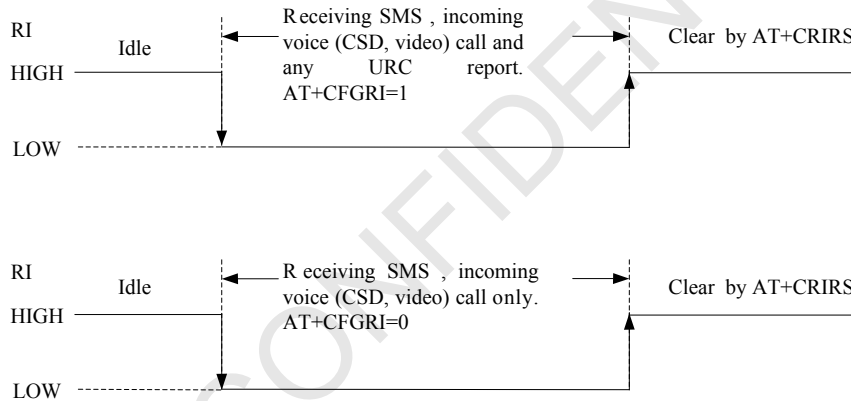

Figure 19: RI behaviour in NULL Modem

If Full Modem is used to establish communication between devices, the pin "RI" is another operation status. Initially it keeps high, when a voice call or CSD call comes, the pin "RI" will change to low for about 5900ms, then it will return to high level for 100ms. It will repeat this procedure until this call is answered or hung up.
Figure 20: RI behaviour in FULL Modem

The SIM5360 UART is 1.8V interface. A level shifter should be used if user's application is equipped with a 3.3V UART interface. The level shifter TXB0108RGYR provided by Texas Instruments is recommended. The reference design of the TXB0108RGYR is in the following figures.
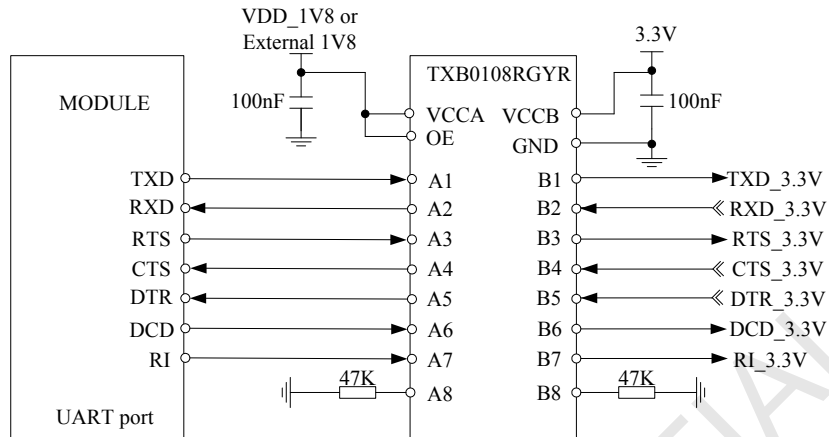

Figure 21: Reference circuit of level shift

To comply with RS-232-C protocol, the RS-232-C level shifter chip should be used to connect SIM5360 to the RS-232-C interface. In this connection, the TTL level and RS-232-C level are converted mutually. SIMCom recommends that user uses the SP3238ECA chip with a full modem. For more information please refers to the RS-232-C chip datasheet.

Note: SIM5360 supports the baud rate: 300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200, 230400, 460800, 921600, 3200000, 3686400, 4000000bps. Default rate is 115200bps.

3.6   SD/MMC Interface

SIM5360 provides one 4-bit SD/MMC interface. Its operation voltage is 2.85V, with clock rates up to 52 MHz. It supports 1-bit SD/MMC or 4-bit SD data transmission mode. Though the same hardware controller is used, the initialization procession for SD or MMC cards is different. SIM5360 will detect which card is inserted automatically.
Note: Interface with SD/MMC memory cards up to 32GB.

3.6.1   Pin Description

Table 13: Pin description

Pin name	Pin No.	Function
SD_DATA0	22	SD card data0
SD_DATA1	23	SD card data1

SD_DATA2	24	SD card data2
SD_DATA3	25	SD card data3
SD_CLK	26	SD card clock
SD_CMD	21	SD card command
VDD_EXT	44	SD card power

Table 14: Electronic characteristic

Symbol	Parameter	Min	Typ	Max	Unit
VDD_EXT	LDO power output	2.71	2.85	2.99	V
V_{IH}	High-level input voltage	0.65·VDD_EXT	-	VDD_EXT+0.3	V
V_{IL}	Low-level input voltage	-0.3	0	0.3·VDD_EXT	V
V_{OH}	High-level output voltage	2.71	2.85	2.99	V
V_{OL}	Low-level output voltage	0	0	0.45	V

3.6.2   Design guide

The module provides a LDO named VDD_EXT for SD card power supply. The LDO is 2.85V by default, capable of 300mA. Data lines should be pulled up to VDD_EXT by 10K resistors. ESD/EMI components should be arranged beside SD card socket. Refer to the following application circuit.
Figure 22: SD interface circuit

3.7   USIM Interface

The USIM provides the required subscription verification information to allow the mobile equipment to attach to a GSM or UMTS network. Both 1.8V and 3.0V SIM Cards are supported.

3.7.1   Pin description

Table 15: Pin description

Pin name	Pin	Description
USIM_CLK	19	USIM Card Clock
USIM_RST	18	USIM Card Reset
USIM_DATA	17	USIM Card data I/O, which has been pulled up with a 22kR resistor to USIM_VDD in module. Do not pull up or pull down in users' application circuit.
USIM_VDD	20	USIM Card Power output depends automatically on USIM mode，one is 3.0V±10%, another is 1.8V±10%. Current is less than 50mA.

Table 16: Electronic characteristic

Symbol	Parameter	3.0V mode			1.8V mode			Unit
		Min	Typ	Max	Min	Typ	Max	
USIM_VDD	LDO power output	2.71	2.85	3.05	1.7	1.8	1.9	V
V_{IH}	High-level input voltage	0.65·USIM_VDD	-	USIM_VDD +0.3	0.65·USIM_VDD	-	USIM_VDD +0.3	V
V_{IL}	Low-level input voltage	-0.3	0	0.3·USIM_VDD	-0.3	0	0.3·USIM_VDD	V
V_{OH}	High-level output voltage	2.71	2.85	3.05	1.7	1.8	1.9	V
V_{OL}	Low-level output voltage	0	0	0.45	0	0	0.45	V

3.7.2   Application Guide

It is recommended to use an ESD protection component such as ST (www.st.com) ESDA6V1W5 or ON SEMI (www.onsemi.com) SMF05C. Note that the SIM peripheral circuit should be close to the SIM card socket. The reference circuit of the 6-pin SIM card holder is illustrated in the following figure.
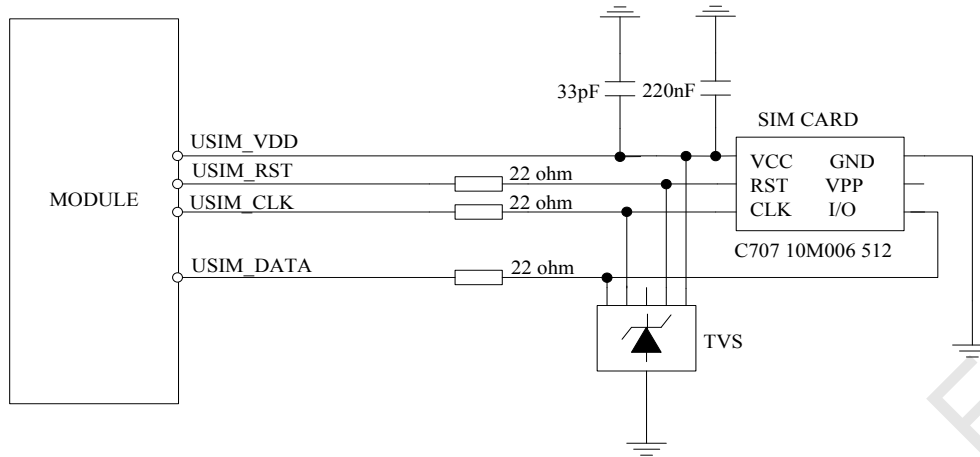

Figure 23: USIM interface reference circuit

Note: USIM_DATA has been pulled up with a 15kohm resistor to USIM_VDD in module. A 220nF shut capacitor on USIM_VDD is used to reduce interference. Use AT Commands to get information in USIM card. For more detail, please refer to document [1].

3.7.3   Recommend Components

For 6 pins USIM socket, SIMCom recommend to use Amphenol **C707 10M006 512**. User can visit http://www.amphenol.com for more information about the holder.
Figure 24: Amphenol SIM card socket

Table 17: Amphenol USIM socket pin description

Pin	Signal	Description
C1	USIM_VDD	SIM Card Power supply, it can identify automatically the SIM Card power mode，one is 3.0V±10%, another is 1.8V±10%.
C2	USIM_RST	SIM Card Reset.
C3	USIM_CLK	SIM Card Clock.
C5	GND	Connect to GND.
C6	USIM_VPP	
C7	USIM_DATA	SIM Card data I/O.

3.8   I2C Interface

I2C is used to communicate with peripheral equipments and can be operated as either a transmitter or receiver, depending on the device function. Use AT Commands "AT+CRIIC and AT+CWIIC" to read/write register values of related peripheral equipments connected with I2C interface. Its operation voltage is 1.8V.

3.8.1   Pin Description

Table 18: Pin description

Pin name	Pin No.	Function
SDA	56	Serial interface data input and output
SCL	55	Serial interface clock input

3.8.2   Signal Description

Both SDA and SCL are bidirectional lines, connected to a positive supply via a pull-up resistor respectively. When the bus is free, both lines are high.

3.8.3   Design Guide

For SIM5360, the data on the I2C bus can be transferred at rates up to 400kbps. The number of peripheral devices connected to the bus is solely dependent on the bus capacitance limit of 400pF. Note that PCB traces length and bending are in users' control to minimize load capacitance.

Note：SDA and SCL have none pulled up resistors in module. So there is need to pull them up in users' application circuit.

3.9 Keypad Interface

SIM5360 module provides a keypad interface that supports five sense lines, or columns, and five keypad rows. The interface generates an interrupt when any key is pressed. Its operation voltage is 1.8V.

3.9.1 Pin Description

Table 19: Pin description

Pin name	Pin No.	Function
KBC0	28	Sensing keys
KBC1	27	
KBC2	31	
KBC3	32	
KBC4	36	
KBR0	30	Driving pads
KBR1	29	
KBR2	30	
KBR3	35	
KBR4	34	

3.9.2 Application Guide

All keypad pins can be configured for GPIOs. These GPIOs also support interruption operation if used as input pins. A typical circuit about the keypad (5*5 keypad matrix) is shown in the following figure.
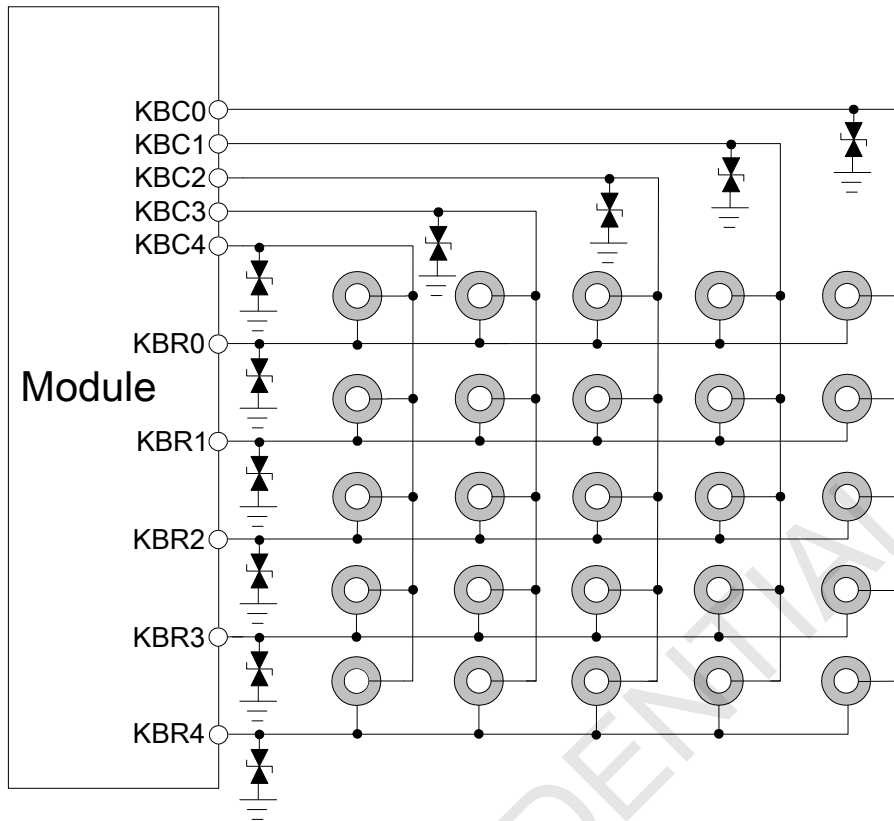

Figure 25: Reference circuit

If these pins are configured for GPIOs, the sequence is listed in the following table.

Table 20: Keypad multiplexing function

Pin name	Pin number	Mode 0(default)	Mode 1
KBR4	34	KBR4	GPIO15
KBR3	35	KBR3	GPIO14
KBR2	30	KBR2	GPIO13
KBR1	33	KBR1	GPIO12
KBR0	29	KBR0	GPIO11
KBC4	36	KBC4	GPIO6
KBC3	32	KBC3	GPIO8
KBC2	31	KBC2	GPIO7
KBC1	27	KBC1	GPIO10
KBC0	28	KBC0	GPIO9

Note: Refer to document [23] for detailed information of Keypad Application Note.

3.10 USB Interface

SIM5360 module contains a USB interface. This interface is compliant with the USB2.0 specification. The USB2.0 specification requires hosts such as the computer to support all three USB speeds, namely low-speed (1.5Mbps), full-speed (12Mbps) and high-speed (480Mbps). USB charging and USB-OTG is not supported.

Table 21: Electronic characteristic

Pin name	Pin No.	Input voltage scope(V)		
		Min	**Typ**	**Max**
USB_VBUS	11	3	5.0	5.25
USB_DP	13	They are compliant with the USB 2.0 specification.		
USB_DN	12			

3.10.1 Application Guide

Currently SIM5360 supports the USB suspend and resume mechanism which can help to save power.   If no transaction is on USB bus, SIM5360 will enter suspend mode. When some events such as voice call or receiving SMS happen, SIM5360 will resume normal mode automatically.
Figure 26: USB interface

Because of high bit rate on USB bus, pay attention to influence of junction capacitance of ESD component on USB data lines. Typically, the capacitance should be less than 4pF @1MHz.
It is recommended to use an ESD protection component such as ON SEMI (www.onsemi.com)
ESD9M5.0ST5G or ESD9L5.0ST5G.

Note：The SIM5360 has two kinds of interface (UART and USB) to connect to host CPU.   USB interface is mapped to five virtual ports: "SIMTECH HS-USB Modem 9000", "SIMTECH HS-USB NMEA 9000", "SIMTECH HS-USB AT port 9000", "SIMTECH HS-USB Diagnostics 9000" and "SIMTECH Wireless HS-USB Ethernet Adapter 9000".

3.11 SPI Interface

SPI interface of SIM5360 is master only. It provides a duplex, synchronous, serial communication link with peripheral devices. Its operation voltage is 1.8V, with clock rates up to 26 MHz.

3.11.1   Pin Description

Table 22: Pin description

Pin name	Pin No.	Function
SPI_CS	9	SPI chip-select; not mandatory in a point-to-point connection
SPI_MISO	7	SPI master in/slave out data
SPI_CLK	6	SPI clock
SPI_MOSI	8	SPI master out/slave in data

Table 23: Electronic characteristic

Symbol	Parameter	Min	Typ	Max	Unit
V_{IH}	High-level input voltage	1.26	1.8	2.1	V
V_{IL}	Low-level input voltage	-0.3	0	0.63	V
V_{OH}	High-level output voltage	1.35	-	1.8	V
V_{OL}	Low-level output voltage	0	0	0.45	V

3.12 GPIO Interface

SIM5360 provides a limited number of GPIO pins. All GPIOs can be configured as inputs or outputs. User can use AT Commands to read or write GPIOs status. Refer to ATC document for details.

3.12.1   Pin Description

Table 24: Pin description

Pin name	Pin No.	I/O	Function
NETLIGHT/GPIO1	51	O	Output PIN as LED control for network status. If it is unused, left open.
GPIO4	54	I	Input PIN as RF operating control. H: Normal Mode L:Flight Mode

			If it is unused, left open.
GPIO40	49	O	Output PIN as operating status indicating of module. H: Power on L: Power off If it is unused, left open.
GPIO41	52	I/O	General input/output PIN. It can be used as wake/interrupt signal to host from module If it is unused, left open.
GPIO42	53	I/O	General Purpose Input/Output Port.
GPIO43	50	I/O	General Purpose Input/Output Port. It can be used as wake/interrupt signal to module from host. If it is unused, left open.
GPIO44	48	I/O	General Purpose Input/Output Port

Note: If more GPIOs need to be used, users can configure GPIO on other multiple function interfaces, such as PCM. Please refer to GPIO list.

Table 25: Electronic characteristic

Symbol	Parameter	Min	Typ	Max	Unit
V_{IH}	High-level input voltage	1.26	1.8	2.1	V
V_{IL}	Low-level input voltage	-0.3	0	0.63	V
V_{OH}	High-level output voltage	1.35	-	1.8	V
V_{OL}	Low-level output voltage	0	0	0.45	V

Note: The output driver current of GPIOs is 2mA.

3.12.2   Application Guide

Network status

GPIO1 is used to control Network Status LED; application circuit is shown below.
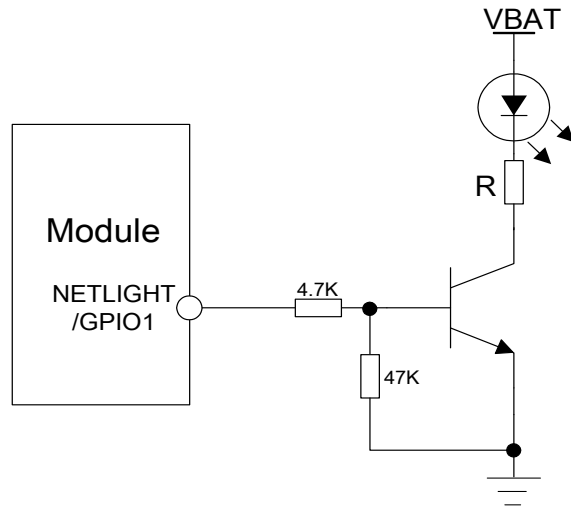

Figure 27: Application circuit

Note: The value of resistor Rx depends on LED characteristic.

Table 26: LED status

LED Status	Module Status
Always On	Searching Network/Call Connect
200ms ON, 200ms OFF	Data Transmit
800ms ON, 800ms OFF	Registered network
Off	Power off / Sleep

Flight mode control

GPIO4 controls SIM5360 module to enter or exit the Flight mode. In Flight mode, SIM5360 closes RF function to prevent interference with other equipments or minimize current consumption. Bidirectional ESD protection component is suggested to add on GPIO4.
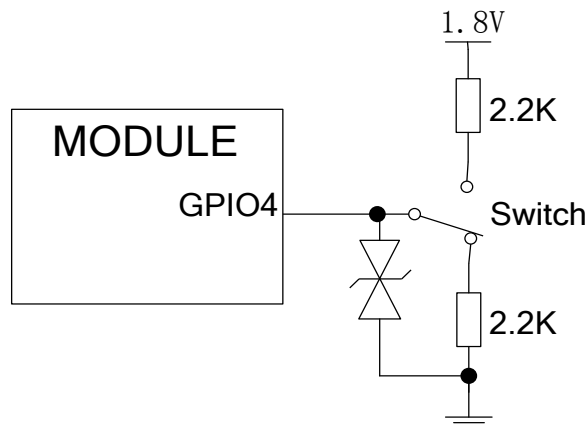

Figure 28: Flight mode switch

Table 27: Control status

GPIO4 Status	Module operation
Low Level	Flight Mode: RF is closed.
High Level	Normal Mode: RF is working.

Note：1. For SIM5360, GPIO0, GPIO2, GPIO3 and GPIO5 have multiplex function, user can use them as PCM interface to connect extend codec. Refer to section 3.11 and document [1] for details.
2. When the module is powered off, make sure all digital interfaces (PCM UART, etc) connected with peripheral devices have no voltage higher than 0.3V. If users' design cannot meet above conditions, high level voltages maybe occur in GPIO pins because current leakage from above digital interfaces may occur.

3.13 PCM Interface

SIM5360 provides hardware PCM interface for external codec. The PCM interface enables communication with an external codec to support hands-free applications. SIM5360 PCM interface can be used in two modes: the default mode is auxiliary PCM (8 KHz long sync mode at 128 KHz PCM CLK); the other mode is primary PCM (8 KHz short sync mode at 2048 KHz PCM CLK).   In short-sync (primary PCM) mode, SIM5360 can be a master or a slave. In long-sync (auxiliary PCM) mode, SIM5360 is always a master. SIM5360 also supports 3 kinds of coding formats: 8 bits (μ-law or A-law) and 16 bits (linear).

Note: PCM interface is multiplexed from GPIO (default setting). The AT command "AT+CPCM" is used to switch between PCM and GPIO functions. Please refer to document [21] and document [1] for details.

3.13.1   Pin Description

Table 28: Pin description

Pins	Pin No.	Description
PCM_OUT	73	PCM data output
PCM_IN	74	PCM data input
PCM_SYNC	75	PCM data synchrony
PCM_CLK	76	PCM data clock

Table 29: Electronic characteristic

Symbol	Parameter	Min	Typ	Max	Unit
V_{IH}	High-level input voltage	1.26	1.8	2.1	V
V_{IL}	Low-level input voltage	-0.3	0	0.63	V
V_{OH}	High-level output voltage	1.35	-	1.8	V
V_{OL}	Low-level output voltage	0	0	0.45	V

3.13.2 Signal Description

The default PCM interface in SIM5360 is the auxiliary PCM interface. The data changes on the high level of PCM_CLK and is sampled at the falling edge of PCM_CLK in one period. Primary PCM is disabled after every power-on or every reset event. So user must use AT command to enable the primary PCM mode after powering on or resetting the module every time if user wants to use Primary PCM.SIM5360 PCM Interface can be operated in Master or Slave mode if it is configured to primary PCM. In Master Mode, the Module drives the clock and sync signals that are sent to the external codec. When it is in Slave Mode, the external codec drives the clock and sync signals which are sent to the module. Both PCM modes are discussed in this section followed by additional PCM topics.

Auxiliary PCM (128 KHz PCM clock)
μ-law coding is supported by the auxiliary PCM. The auxiliary codec port operates with standard long-sync timing and a 128 KHz clock.   The AUX_PCM_SYNC runs at 8 KHz with 50% duty cycle. Most μ-law codec support the 128 KHz clock.
Figure 29: Synchrony timing
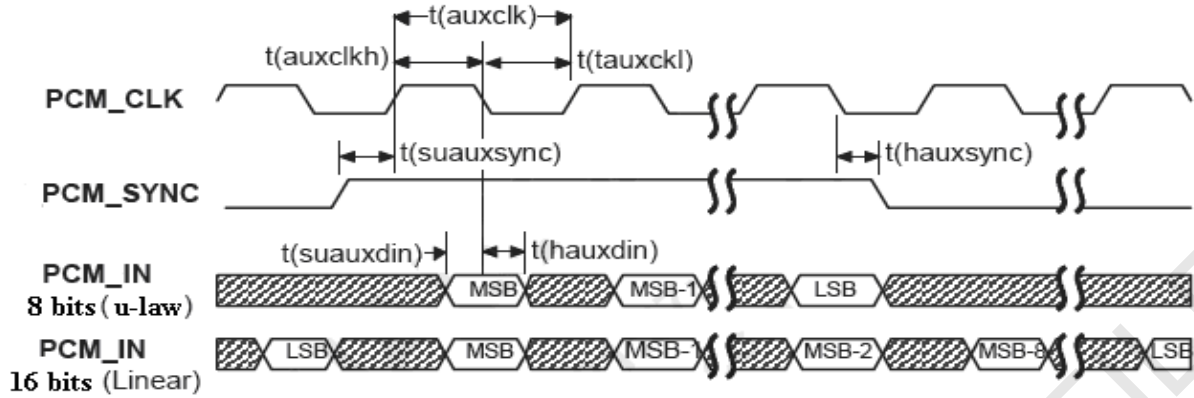

Figure 30: EXT CODEC to MODULE timing
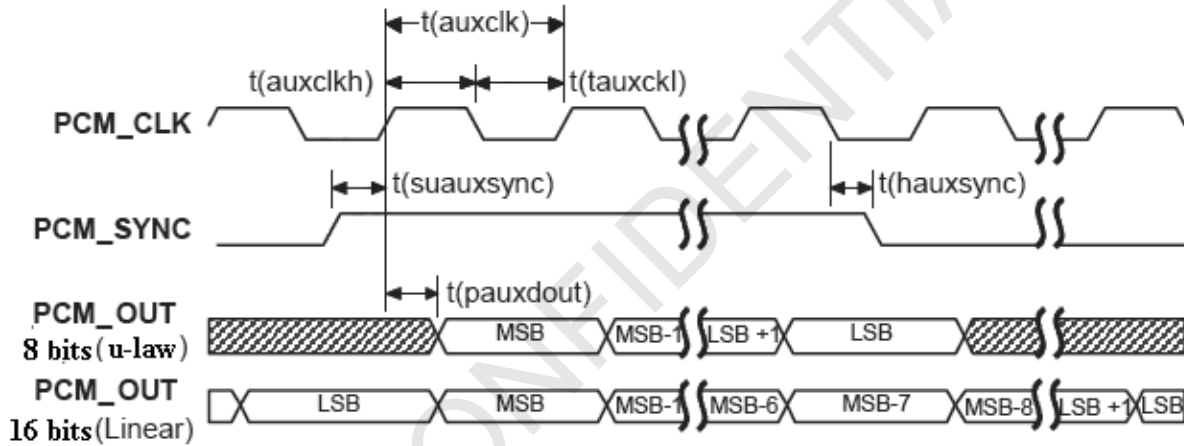

Figure 31: MODULE to EXT CODEC timing

Table 30: Timing parameters

Parameter	Description	Min	Typ	Max	Unit
T(auxsync)	AUX_PCM_SYNC cycle time	–	125	-	μs
T(auxsynch)	AUX_PCM_SYNC high time	62.4	62.5	-	μs
T(auxsyncl)	AUX_PCM_SYNC low time	62.4	62.5	-	μs
T(auxclk)*	AUX_PCM_CLK cycle time	-	7.8	–	μs
T(auxclkh)	AUX_PCM_CLK high time	3.8	3.9	–	μs
T(auxclkl)	AUX_PCM_CLK low time	3.8	3.9	–	μs
T(suauxsync)	AUX_PCM_SYNC setup time high before falling edge of PCM_CLK	1.95	–	–	μs
T(hauxsync)	AUX_PCM SYNC hold time after falling edge of PCM_CLK	1.95	–	–	μs

T(suauxdin)	AUX_PCM_IN setup time before falling edge of AUX_PCM_CLK	70	–	–	ns
T(hauxdin)	AUX_PCM_IN hold time after falling edge of AUX_PCM_CLK	20	–	–	ns
T(pauxdout)	Delay from AUX_PCM_CLK rising to AUX_PCM_OUT valid	–	–	50	ns

*Note: T(auxclk) = 1/(128 KHz).

Primary PCM (2048 KHz PCM clock)

SIM5360 also supports 2.048 MHz PCM data and sync timing for ʋ-law codec. This is called the primary PCM interface. User can use AT command to take the mode you want as discussed above.
Figure 32: Synchrony timing
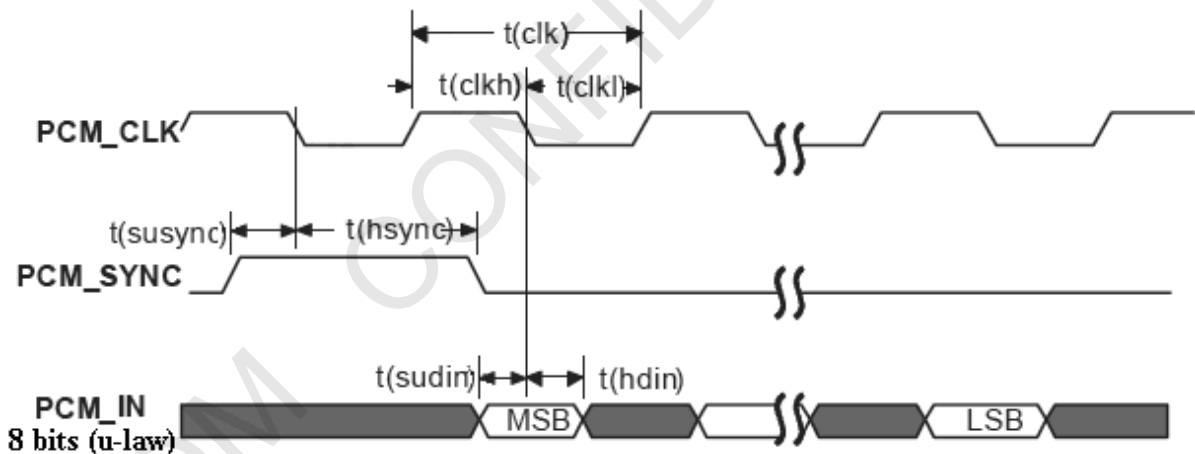

Figure 33: EXT CODEC to MODULE timing
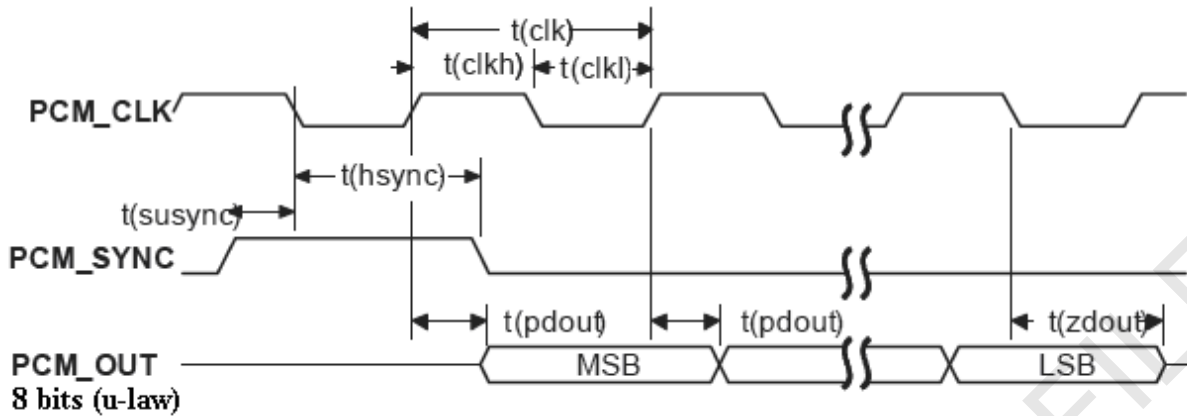

Figure 34: MODULE to EXT CODEC timing

Table 31: Timing parameters

Parameter	Description	Min	Typ	Max	Unit
T(sync)	PCM_SYNC cycle time	–	125	–	μs
T(synch)	PCM_SYNC high time	400	500	–	ns
T(syncl)	PCM_SYNC low time	–	124.5	–	μs
T(clk)	PCM_CLK cycle time	–	488	–	ns
T(clkh)	PCM_CLK high time	–	244	–	ns
T(clkl)	PCM_CLK low time	–	244	–	ns
T(susync)	PCM_SYNC setup time high before falling edge of PCM_CLK	60	–	–	ns
T(hsync)	PCM_SYNC hold time after falling edge of PCM_CLK	60	–	–	ns
T(sudin)	PCM_IN setup time before falling edge of PCM_CLK	50	–	–	ns
T(hdin)	PCM_IN hold time after falling edge of PCM_CLK	10	–	–	ns
T(pdout)	Delay from PCM_CLK rising to PCM_OUT valid	–	–	350	ns
T(zdout)	Delay from PCM_CLK falling to PCM_OUT HIGH-Z	–	160	–	ns

Note: SIM5360 can transmit PCM data by USB except for PCM interface.

3.13.3   Application Guide

The mode of SIM5360 PCM can be configured by AT command "AT+CPCM and AT+CPCMFMT", and the default configuration is master mode using short sync data format with 2.048MHz PCM_CLK and 8 kHz PCM_SYNC. Please refer to document [21] and document [1] for details.

In addition, the firmware of SIM5360 has integrated the configuration on NAU8810GY and WM8960CGEFL/RV codec with I2C interface.

NAU8810GY is provided by Nuvoton Technology Corporation.

WM8960CGEFL/RV is provided by Wolfson Microelectronics.

Solution I: The Reference Design of NAU8810GY CODEC (Priority Solution)

The following is the reference circuit.
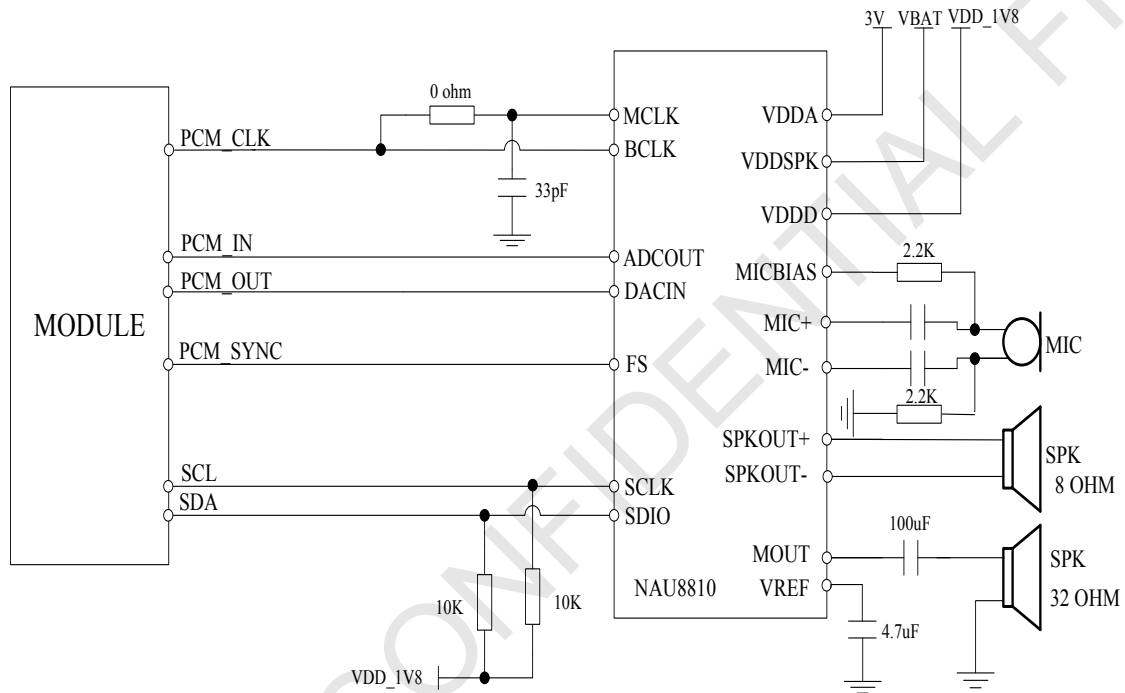

Figure 35: Reference Circuit of PCM Application with NAU8810GY Codec

Solution II: The Reference Design of WM8960CGEFL/RV CODEC

It is recommended to use a 26MHz CXO component such as TXC CORPORATION (www.txccorp.com) 8W26000011. The following is the reference circuit.
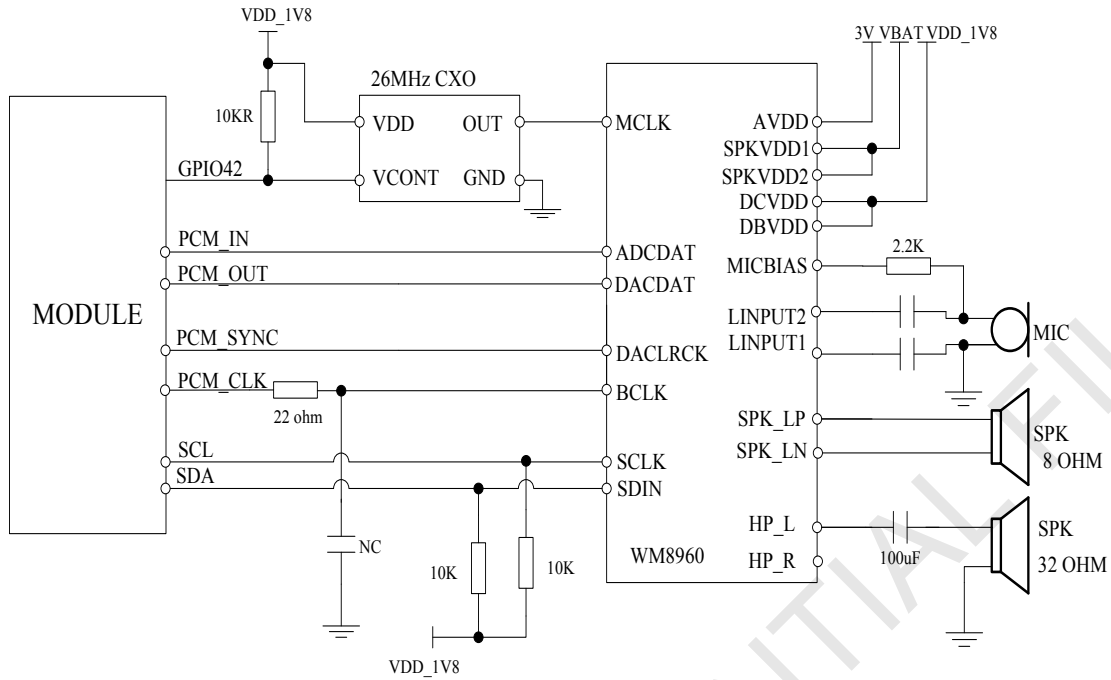

Figure 36: Reference Circuit of PCM Application with WM8960 Codec

3.14 GNSS (GPS and GLONASS)

SIM5360 merges GNSS (GPS/GLONASS) satellite and network information to provide a high-availability solution that offers industry-leading accuracy and performance. This solution performs well, even in very challenging environmental conditions where conventional GNSS receivers fail, and provides a platform to enable wireless operators to address both location-based services and emergency mandates.

3.14.1 Technical specification

Table 32: GNSS Technical specification

Characteristics	Specification
Tracking sensitivity	GPS : -159 dBm GLONASS : -158 dBm
Cold-start sensitivity	-148 dBm
Accuracy (Open Sky)	2.5m (CEP50)
TTFF (Open Sky)	Hot start <1s Cold start 35s
Receiver Type	16-channel, C/A Code
Frequency	GPS : L1 Frequency (1575.42±1.023MHz), GLONASS : 1597.5~1605.8 MHz
Update rate	Default 1 Hz
GNSS data format	NMEA-0183

GNSS antenna	Passive antenna

Note: Performance will vary depending on the environment, antenna type and signal conditions and so on.

3.14.2   Operate Mode

SIM5360 supports both A-GPS and S-GPS, and then provides three operating modes: mobile-assisted mode, mobile-based mode and standalone mode. A-GPS includes mobile-assisted and mobile-based mode.

In mobile-assisted mode, when a request for position location is issued, available network information is provided to the location server (e.g. Cell-ID) and assistance is requested from the location server. The location server sends the assistance information to the handset. The handset/mobile unit measures the GNSS observables and provides the GNSS measurements along with available network data (that is appropriate for the given air interface technology) to the location server. The location server then calculates the position location and returns results to the requesting entity.

In mobile-based mode, the assistant data provided by the location server encompasses not only the information required to assist the handset in measuring the satellite signals, but also the information required to calculate the handset's position.   Therefore, rather than provide the GNSS measurements and available network data back to the location server, the mobile calculates the location on the handset and passes the result to the requesting entity.

In standalone (autonomous) mode, the handset demodulates the data directly from the GNSS satellites. This mode has some reduced cold-start sensitivity, and a longer time to first fix as compared to the assisted modes.   However, it requires no server interaction and works out of network coverage.

This combination of GNSS measurements and available network information provides:

● High-sensitivity solution that works in all terrains: Indoor, outdoor, urban, and rural
● High availability that is enabled by using both satellite and network information

Therefore, while network solutions typically perform poorly in rural areas and areas of poor cell geometry/density, and while unassisted, GNSS-only solutions typically perform poorly indoors.   The SIM5360 GNSS solution provides optimal time to fix, accuracy, sensitivity, availability, and reduced network utilization in both of these environments, depending on the given condition.

3.14.3   Application Guide

Users can adopt an active antenna or a passive antenna as GNSS signal transceiver. In this document, all GNSS specification mentioned is from passive antenna. The following is the reference circuit.
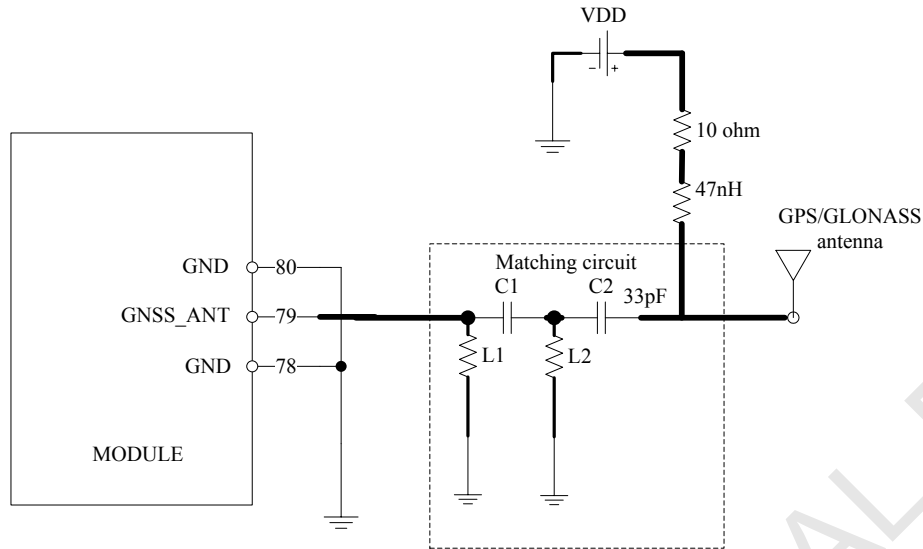

Figure 37: Active antenna circuit
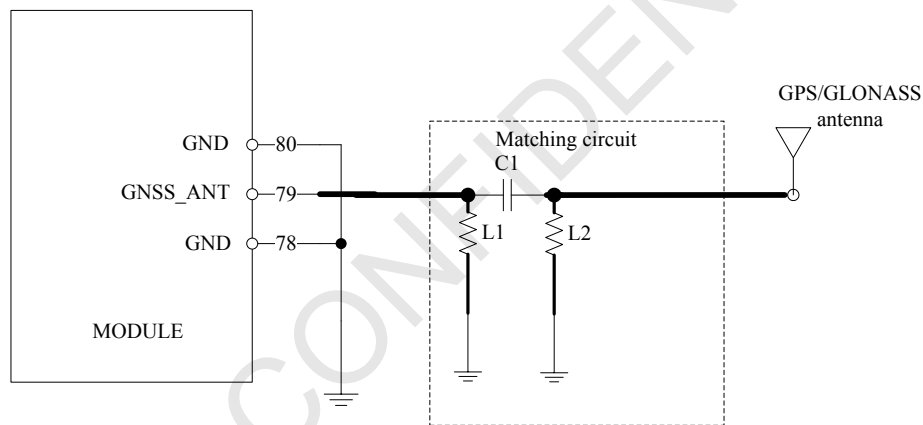

Figure 38：Passive antenna circuit (Default)

In above figures, the components C1 and L1, L2 are used for antenna matching, the values of the components can only be obtained after the antenna tuning usually, and they are provided by antenna vendor.C2 in Figure 36 is used for DC isolation. In active antenna circuit, users must use an external LDO/DCDC to provide VDD voltage whose value should be taken according active antenna characteristic, and VDD can be shut down to avoid consuming additional current when not being used.

GNSS can be used by NMEA port. User can select NMEA as output through UART or USB. NMEA sentences are automatic and no command is provided. NMEA sentences include GSV, GGA, RMC, GSA, and VTG. Before using GNSS, user should configure SIM5360 in proper operating mode by AT command. Please refer to related document for details. SIM5360 can also get position location information through AT directly.

Note: GNSS is closed by default, it could be started by AT+CGPS. The AT command has two parameters, the first is on/off, and the second is GNSS mode. Default mode is standalone mode.

AGPS mode needs more support from the mobile telecommunication network. Refer to AGPS application document for details.

3.15 Multi-functional interface

SIM5360 merges functions for various applications. It can enrich users' design and lower the cost of users' hardware.

3.15.1 Sink Current Source

The dedicated pin (ISINK) is intended for driving passive devices，such as LCD backlight, this implementation is VBAT tolerant and suitable for driving white LEDs. The high-current driver can maintain a constant current which is set by *the AT command "AT+ CLEDITST"*, capable of up to 40 mA.

Table 33: Electronic characteristic

Symbol	Description	Min	Typ	Max	Unit
ISINK	Input voltage	0.5	VDD	VBAT	V
I_O	Input current	5	-	40	mA

Since the driver is ground-referenced current sink, the operating device it drives must form a current path between the VDD pin and the ISINK pin. The following figure is for users reference.
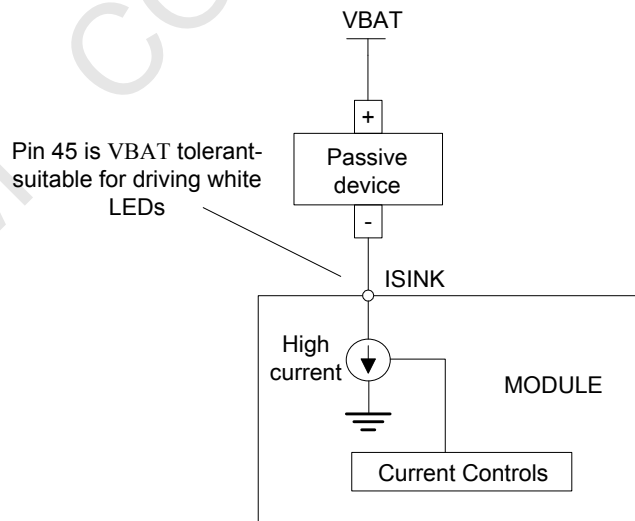

Figure 39: Current drive

3.15.2 ADC

SIM5360 has two dedicated ADC that is available for digitizing analog signals such as battery voltage and so on; it is on PIN 47 and PIN 46 , namely ADC1 and ADC2 . This ADC is 15 bit successive-approximation circuit, and electronic specification is shown in the following table.

Table 34: Electronic Characteristics

Specification	Min	Typ	Max	Unit	Comments/Conditions
Resolution			15	Bits	
Analog input bandwidth	–	100	–	kHz	Analog Vdd = ADC reference 2.4MHz sample rate
Gain Error	-2.5		+2.5	%	
Offset Error	-3.5		+3.5	LSB	
Input Range	GND		2.2V	V	
Input serial resistance		2		kΩ	Sample and hold switch resistance
Power supply current Normal operation		1.5		mA	
Power supply current Off		50	200	nA	

User can introduce a signal in the ADC pin directly and use the AT command "AT+CADC" to get the raw data which is between 0 and 32768. The data can be transformed to any type such as voltage, temperature etc. Please refer to *document [1]*.

Note: The input signal voltage value in ADC must not be higher than 2.2V.

3.15.3 LDO

SIM5360 has a LDO power output, namely VDD_EXT. The LDO is available and output voltage is 2.85v by default, rated for 300mA. User can switch the LDO on or off by the AT command "AT+CVAUXS" and configure its output voltage by the AT command "AT+CVAUXV".

Table 35: Electronic characteristic

Symbol	Description	Min	Typ	Max	Unit
VDD_EXT	Output voltage	1.5	2.85	3.05	V
I_O	Output current	-	-	300	mA

Frequency	Receive sensitivity
GSM850	< -109dBm
E-GSM900	< -109dBm
DCS1800	< -109dBm
DCS1800	< -109dBm
WCDMA 2100	< -110dBm
WCDMA 1900	< -110dBm
WCDMA 850	< -110dBm
WCDMA 900	< -110dBm

4.2   Operating Specification

SIM5360 can support high rate data by GSM/WCDMA wireless network. In the different network environment, data transmission rate shifts depending on modulation and encoding.

Table 39: GPRS/EDGE data throughout

Function	Coding schemes	1 Timeslot	2 Timeslot	4 Timeslot
GPRS	CS-1	9.05kbps	18.1kbps	36.2kbps
	CS-2	13.4kbps	26.8kbps	53.6kbps
	CS-3	15.6kbps	31.2kbps	62.4kbps
	CS-4	21.4kbps	42.8kbps	85.6kbps
EDGE	MCS-1	8.80kbps	17.6kbps	35.20kbps
	MCS-2	11.2kbps	22.4kbps	44.8kbps
	MCS-3	14.8kbps	29.6kbps	59.2kbps
	MCS-4	17.6kbps	35.2kbps	70.4kbps
	MCS-5	22.4kbps	44.8kbps	89.6kbps
	MCS-6	29.6kbps	59.2kbps	118.4kbps
	MCS-7	44.8kbps	89.6kbps	179.2kbps
	MCS-8	54.4kbps	108.8kbps	217.6kbps
	MCS-9	59.2kbps	118.4kbps	236.8kbps

Table 40: HSDPA throughout

Category	Supported	Max supported HS-DSCH codes	Theoretical max peak rate(Mbps)	Modulation
Category1		5	1.2	16QAM,QPSK
Category2		5	1.2	16QAM,QPSK
Category3		5	1.8	16QAM,QPSK
Category4		5	1.8	16QAM,QPSK
Category5	✓	5	3.6	16QAM,QPSK
Category6	✓	5	3.6	16QAM,QPSK
Category7	✓	10	7.2	16QAM,QPSK
Category8	✓	10	7.2	16QAM,QPSK
Category9		15	10.0	16QAM,QPSK
Category10	✓	15	14.0	16QAM,QPSK
Category11		5	0.9	QPSK
Category12	✓	5	1.8	QPSK

Note: Actual throughout rates depend on network configuration, network loading, signal condition and so on.

4.3 Antenna Design Guide

SIM5360 provides RF antenna interface. Customer's antenna should be located in the host board and connected to module's antenna pad through micro-strip line or other types of RF trace and the trace impedance must be controlled in 50Ω. SIMCom recommends that the total insertion loss between the antenna pad and antenna should meet the following requirements:

- GSM900/GSM850<0.5dB
- DCS1800/PCS1900 <0.9dB
- WCDMA 2100/1900<0.9dB
- WCDMA 900/850<0.5dB

To facilitate the antenna tuning and certification test, a RF connector and an antenna matching circuit should be added. The following figure is the recommended circuit.
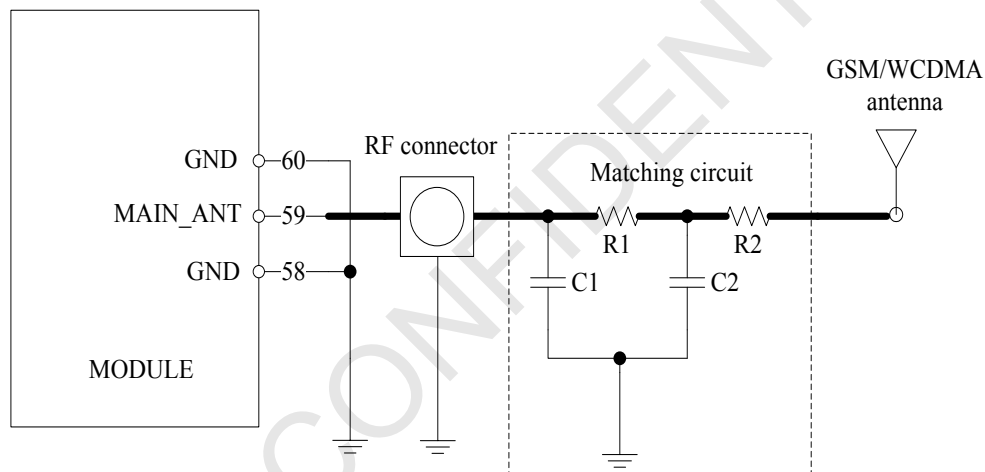

Figure 40: Antenna matching circuit (MAIN_ANT)

In this figure, the components R1,C1,C2 and R2 is used for antenna matching, the value of components can only be got after the antenna tuning, usually, they are provided by antenna vendor. By default, the R1, R2 are 0 ohm resistors, and the C1, C2 are reserved for tuning.

The RF test connector in the figure is used for the conducted RF performance test, and should be placed as close as to the module's antenna pin. The traces impedance between components must be controlled in 50ohm.
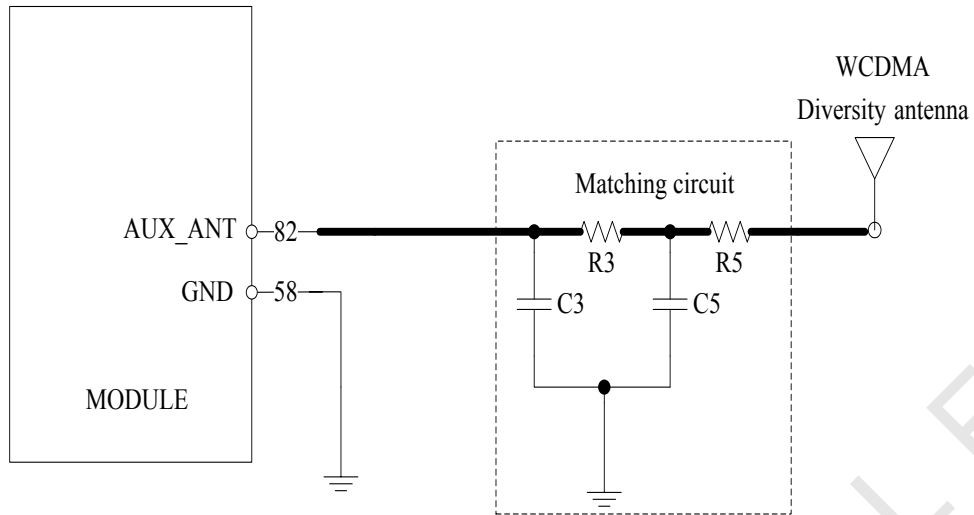

Figure 41: Antenna matching circuit (AUX_ANT)

In above figure, the components R3,C3,C5 and R5 is used for diversity antenna matching. The method of antenna tuning is same as MAIN_ANT.

5   Electrical, Reliability and Operating Characteristics

5.1   Electronic Characteristics

Absolute maximum rating for digital and analog pins of SIM5360 are listed in the following table:

Table 41: Absolute maximum ratings

Parameter	Min	Max	Unit
Voltage at digital pins (1.8v digital I/O)	-0.3	2.1	V
Voltage at VBAT	-0.5	6.0	V
Voltage at VRTC	-	3.25	V
Voltage at USB_VBUS	-0.5	6.0	V

Table 42: Recommended operating ratings

Parameter	Min	Typ	Max	Unit
Voltage at digital pins (1.8v digital I/O)	0	1.8	1.95	V
Voltage at VBAT	3.4	3.8	4.2	V
Voltage at VRTC	2	-	3.2	V
Voltage at USB_VBUS	3	5	5.25	V

The operating temperature and power specification is listed in the following table.

Table 43: Operating temperature

Parameter	Min	Typ	Max	Unit
Normal operation temperature	-30	25	80	℃
Extended operation temperature	-40	25	85	℃
Storage temperature	-45	25	+90	℃

Note: The module is fully functional in all the temperature range. Temperatures outside of the range -30℃ ~ +80℃ might slightly deviate from ETSI specifications.
Functional: the module is able to make and receive voice calls, data calls, SMS and make GPRS/WCDMA/HSPA+ traffic.

5.2   Operating Mode

The following table summarizes the various operating modes, each operating modes will be referred to in the following chapters.

5.2.1   Operating Modes Overview

Table 44: Operating Modes Overview

Mode	Function	
Sleep mode	GSM/WCDMA SLEEP	Module will automatically enter SLEEP mode if DTR is set to high level and there is no on air or hardware interrupt (such as GPIO interrupt or data on serial port). In this case, the current consumption of module will be reduced to the minimal level. In SLEEP mode, the module can still receive paging message，voice call and SMS.
GSM	GSM IDLE	Software is active. Module has registered to the GSM network, and the module is ready to communicate.
GSM	GSM TALK	Connection between two subscribers is in progress. In this case, the power consumption depends on network settings (DTX off/on, FR/EFR/HR, hopping sequences, etc.) and antenna.
GPRS	GPRS STANDBY	Module is ready for GPRS data transfer, but no data is currently sent or received. In this case, power consumption depends on network settings and GPRS configuration.
GPRS	GPRS DATA	There is GPRS data transfer (PPP or TCP or UDP) in progress. In this case, power consumption is related with network settings (e.g. power control level), uplink/downlink data rates and GPRS configuration (e.g. used multi-slot settings).
EDGE	EDGE STANDBY	Module is ready for data transfer in EDGE mode, but no data is currently sent or received. In this case, power consumption depends on network settings and EDGE configuration
EDGE	EDGE DATA	There is EDGE data transfer (PPP or TCP or UDP) in progress. In this case, power consumption is related with network settings (e.g. power control level), uplink/downlink data rates and EDGE configuration.
WCDMA	WCDMA IDLE	Module has registered to the WCDMA network, and the module is ready to communicate.
WCDMA	WCDMA TALK	Module is active in WCDMA mode. The power consumption depends on network settings.
HSPA	HSPA IDLE	Module is ready for data transmission, but no data is currently sent or received. Power consumption depends on network settings and HSPA configuration
HSPA	HSPA DATA	There is HSDPA data transfer (PPP or TCP or UDP) in progress. In this case, power consumption is related with network settings (e.g. power control level), uplink/downlink data rates and HSPA configuration
Power down		Module can be powered down by the AT command "AT+CPOF" or the PWRKEY pin. The power management unit shuts down the power supply of the module, only the power supply of RTC is remained. The serial interface is not accessible. Operating voltage (connected to VBAT) remains applied.
Minimum functionality mode		The AT command "AT+CFUN" can be used to set the module to a minimum functionality mode without removing the power supply. In this mode, the RF part of the module will not work or the SIM card will not be accessible, or both will be closed, and the serial port is still accessible. The power consumption in this mode is very low.

5.3   Current Consumption

The current consumption in suspended mode and without USB connection is listed in the table below. Here, "suspended mode" means that SIM5360 is connected to USB bus, but it does not transfer data.

Table 45: Current consumption

OFF state	
OFF state supply current	Power down 10uA
GNSS Current consumption (WCDMA/GSM idle mode)	
GNSS supply current	100mA (Total supply current)
GSM Sleep mode (without USB connection)	
GSM/GPRS supply current (GNSS off)	Sleep mode @DRX=2 2.7mA Sleep mode @DRX=5 1.5mA Sleep mode @DRX=9 1.2mA
GSM Sleep Mode (with USB suspended)	
GSM/GPRS supply current (GNSS off)	Sleep mode @DRX=2 3.8mA Sleep mode @DRX=5 2.1mA Sleep mode @DRX=9 1.7mA
Voice Call	
GSM850	@power level #5 <300mA,Typical 263mA
GSM 900	@power level #5 <300mA,Typical 261mA
DCS1800	@power level #0 <250mA,Typical 218mA
PCS1900	@power level #0 <260mA,Typical 257mA
GPRS Data	
DATA mode, GPRS (1 Rx,4 Tx) CLASS 12	
GSM 850	@power level #5 <660mA,Typical 525mA
GSM 900	@power level #5 <660mA,Typical 480mA
DCS1800	@power level #0 <530mA,Typical 420mA
PCS1900	@power level #0 <530mA,Typical 420mA
DATA mode, GPRS (3Rx, 2 Tx) CLASS 12	
GSM 850	@power level #5 <460mA,Typical 360mA
GSM 900	@power level #5 <440mA,Typical 325mA
DCS1800	@power level #0 <400mA,Typical 285mA
PCS1900	@power level #0 <300mA,Typical 295mA
EDGE Data	
DATA mode, EDGE(1 Rx,4 Tx) CLASS 12	
GSM 850	@power level #8 <500mA,Typical 370mA
GSM 900	@power level #8 <500mA,Typical 365mA
DCS1800	@power level #2 <450mA,Typical 350mA
PCS1900	@power level #2 <450mA,Typical 350mA
DATA mode, EDGE(3Rx, 2 Tx) CLASS 12	
GSM 850	@power level #8 <330mA,Typical 250mA
GSM 900	@power level #8 <330mA,Typical 250mA
DCS1800	@power level #2 <300mA,Typical 225mA
PCS1900	@power level #2 <300mA,Typical 225mA

UMTS Sleep/Idle Mode (without USB connection)	
WCDMA supply current (GNSS off)	Sleep mode@DRX=9 1.1 mA
	Sleep mode @DRX=8 1.3 mA
	Sleep mode @DRX=6 2.8 mA
	Idle mode @DRX=6 15 mA
UMTS Sleep/Idle Mode (with USB suspended)	
WCDMA supply current (GNSS off)	Sleep mode @DRX=9 1.3 mA
	Sleep mode @DRX=8 1.6 mA
	Sleep mode @DRX=6 3.1 mA
	Idle mode @DRX=6 32 mA
UMTS Talk	
WCDMA 2100	@Power 23dBm Typical 460 mA
	@Power 21dBm Typical 410 mA
	@Power 10dBm Typical 245 mA
WCDMA 1900	@Power 23dBm Typical 460 mA
	@Power 21dBm Typical 440 mA
	@Power 10dBm Typical 280 mA
WCDMA 850	@Power 23dBm Typical 440 mA
	@Power 21dBm Typical 400 mA
	@Power 10dBm Typical 250 mA
WCDMA 900	@Power 23dBm Typical 400 mA
	@Power 21dBm Typical 355 mA
	@Power 10dBm Typical 230 mA
HSDPA Data	
WCDMA 2100	@Power 23dBm CQI=22 Typical 520 mA
WCDMA 1900	@Power 23dBm CQI=22 Typical 510 mA
WCDMA 850	@Power 23dBm CQI=22 Typical 460 mA
WCDMA 900	@Power 23dBm CQI=22 Typical 450 mA

5.4   EMC and ESD Notes

EMC tests should be performed to detect any potential problems. Possible harmful emissions radiate by the application to the RF receiver in the receiver band. RF emissions interfere with audio input/output. It is recommended to shield the sensitive components and trace with common ground and user can add beads where necessary.

Normally SIM5360 is mounted on customer host board. Although some ESD components have been added in SIM5360, to prevent ESD, user should put some ESD components on customers' board. The ESD components should be placed beside the connectors which human body might touch, such as SIM card holder, audio jacks, switches, keys, etc. The following table is the SIM5360 ESD measurement performance; the results are from SIMCom EVB test.

Table 46: The ESD performance measurement table (Temperature: 25℃, Humidity: 45%)

Part	Contact discharge	Air discharge
VBAT,GND	±5KV	±10KV
UART,USB	±2KV	±6KV
Antenna port	±5KV	±10KV
Other PADs	±0.5KV	±1KV

6 Guide for Production

6.1 Top and Bottom View of SIM5360
Figure 42: Top and bottom view of SIM5360

These test points are only used for module manufacturing and testing. They are not for customer's application.

6.2 Typical Solder Reflow Profile

For customer convenience, SIMCom provides a typical example for a commonly used soldering profile. In final board assembly, the typical solder reflow profile will be determined by the largest component on the board, as well as the type of solder/flux used and PCB stack-up. Therefore the soldering profile shown below is only a generic recommendation and should be adjusted to the specific application and manufacturing constraints.

Figure 43: The ramp-soak-spike reflow profile of SIM5360

For details about secondary SMT, please refer to *document [26]*.
6.3   Moisture Sensitivity Level (MSL)

SIM5360 is qualified to Moisture Sensitivity Level (MSL) 5 in accordance with JEDEC J-STD-033. The module should be mounted within 48 hours after unpacking in the environmental conditions of temperature <30°C and relative humidity of <60% (RH). It is necessary to bake the module if the above conditions are not met:

Table 47: Moisture sensitivity level and floor life

Moisture Sensitivity Level (MSL)	Floor Life (out of bag) at factory ambient≤30° C/60% RH or as stated
1	Unlimited at ≦30℃/85% RH
2	1 year
2a	4 weeks
3	168 hours
4	72 hours
5	48 hours
5a	24 hours
6	Mandatory bake before use. After bake, it must be reflowed within the time limit specified on the label.

NOTE:

  For product handling, storage, processing, IPC / JEDEC J-STD-033 must be followed.

6.4 Baking Requirements

Because of its sensitivity to moisture absorption, SIM5360 should be baked sufficiently before re-flow soldering. Otherwise SIM5360 will be at the risk of permanent damage during re-flow soldering. SIM5360 should be baked 192 hours at temperature 40°C +5°C /-0°C and <5% RH for low-temperature device containers, or 72 hours at temperature 80°C±5°C for high-temperature device containers. Care should be taken that the plastic tray is not heat resistant, SIM5360 modules should be taken out for baking, and otherwise the tray may be damaged by high-temperature during baking.

Table 48: Baking requirements

Baking temperature	Moisture	Time
40℃+5℃/-0℃	<5%	192 hours
85℃±5℃	<5%	72 hours

6.5 Stencil Foil Design Recommendation

The recommended thickness of stencil foil is 0.15mm.

Abbreviation	Description
ADC	Analog-to-Digital Converter
ARP	Antenna Reference Point
BER	Bit Error Rate
BTS	Base Transceiver Station
CS	Coding Scheme
CSD	Circuit Switched Data
CTS	Clear to Send
DAC	Digital-to-Analog Converter
DRX	Discontinuous Reception
DSP	Digital Signal Processor
DTE	Data Terminal Equipment (typically computer, terminal, printer)
DTR	Data Terminal Ready
DTX	Discontinuous Transmission
EFR	Enhanced Full Rate
EGSM	Enhanced GSM
EMC	Electromagnetic Compatibility
ESD	Electrostatic Discharge
ETS	European Telecommunication Standard
FCC	Federal Communications Commission (U.S.)
FD	SIM fix dialing phonebook
FDMA	Frequency Division Multiple Access
FR	Full Rate
GMSK	Gaussian Minimum Shift Keying
GPRS	General Packet Radio Service
GSM	Global Standard for Mobile Communications
HR	Half Rate
I2C	Inter-Integrated Circuit
IMEI	International Mobile Equipment Identity
Inorm	Normal Current
Imax	Maximum Load Current
kbps	Kilo bits per second
Li-Ion	Lithium-Ion
MO	Mobile Originated
MS	Mobile Station (GSM engine), also referred to as TE
MT	Mobile Terminated
PAP	Password Authentication Protocol
PBCCH	Packet Switched Broadcast Control Channel
PCB	Printed Circuit Board
PCS	Personal Communication System, also referred to as GSM 1900
RF	Radio Frequency
RMS	Root Mean Square (value)
RTC	Real Time Clock

Rx	Receive Direction
SIM	Subscriber Identification Module
SMS	Short Message Service
SPI	serial peripheral interface
TDMA	Time Division Multiple Access
TE	Terminal Equipment, also referred to as DTE
TX	Transmit Direction
UART	Universal Asynchronous Receiver & Transmitter
VSWR	Voltage Standing Wave Ratio
Vmax	Maximum Voltage Value
Vnorm	Normal Voltage Value
Vmin	Minimum Voltage Value
VIHmax	Maximum Input High Level Voltage Value
VIHmin	Minimum Input High Level Voltage Value
VILmax	Maximum Input Low Level Voltage Value
VILmin	Minimum Input Low Level Voltage Value
VImax	Absolute Maximum Input Voltage Value
VImin	Absolute Minimum Input Voltage Value
VOHmax	Maximum Output High Level Voltage Value
VOHmin	Minimum Output High Level Voltage Value
VOLmax	Maximum Output Low Level Voltage Value
VOLmin	Minimum Output Low Level Voltage Value
SM	SIM phonebook
NC	Not connect
EDGE	Enhanced data rates for GSM evolution
HSDPA	High Speed Downlink Packet Access
HSUPA	High Speed Uplink Packet Access
ZIF	Zero intermediate frequency
WCDMA	Wideband Code Division Multiple Access
VCTCXO	Voltage control temperature-compensated crystal oscillator
USIM	Universal subscriber identity module
UMTS	Universal mobile telecommunications system
UART	Universal asynchronous receiver transmitter

F. Safety Caution

Table 53: Safety caution

Marks	Requirements
♥	When in a hospital or other health care facility, observe the restrictions about the use of mobiles. Switch the cellular terminal or mobile off, medical equipment may be sensitive to not operate normally for RF energy interference.
✈	Switch off the cellular terminal or mobile before boarding an aircraft. Make sure it is switched off. The operation of wireless appliances in an aircraft is forbidden to prevent interference with communication systems. Forget to think much of these instructions may lead to the flight safety or offend against local legal action, or both.
🔥	Do not operate the cellular terminal or mobile in the presence of flammable gases or fumes. Switch off the cellular terminal when you are near petrol stations, fuel depots, chemical plants or where blasting operations are in progress. Operation of any electrical equipment in potentially explosive atmospheres can constitute a safety hazard.
≈	Your cellular terminal or mobile receives and transmits radio frequency energy while switched on. RF interference can occur if it is used close to TV sets, radios, computers or other electric equipment.
🚗	Road safety comes first! Do not use a hand-held cellular terminal or mobile when driving a vehicle, unless it is securely mounted in a holder for hands free operation. Before making a call with a hand-held terminal or mobile, park the vehicle.
SOS	GSM cellular terminals or mobiles operate over radio frequency signals and cellular networks and cannot be guaranteed to connect in all conditions, for example no mobile fee or a invalid SIM card. While you are in this condition and need emergent help, please remember using emergency calls. In order to make or receive calls, the cellular terminal or mobile must be switched on and in a service area with adequate cellular signal strength. Some networks do not allow for emergency call if certain network services or phone features are in use (e.g. lock functions, fixed dialing etc.). You may have to deactivate those features before you can make an emergency call. Also, some networks require that a valid SIM card be properly inserted in the cellular terminal or mobile.
