1 Introduction

This document describes the electronic specifications, RF specifications, interfaces, mechanical characteristics and testing results of the SIMCom module. With the help of this document and other software application notes/user guides, users can understand and use module to design and develop applications quickly.

1.1 Product Outline

Aimed at the global market, the module support GSM, WCDMA, LTE-TDD and LTE-FDD. Users can choose the module according to the wireless network configuration. The supported radio frequency bands are described in the following table.

Table1: Module frequency bands

Standard	Frequency	SIM7600G	SIM7600G-H	SIM7600NA	SIM7600NA-H
GSM	850MHz	√	√		
	900MHz	√	√		
	1800M Hz	√	√		
	1900M Hz	√	√

Category		CAT1	CAT4	CAT1	CAT4

With a small physical dimension of 30*30*2.9 mm and with the functions integrated, the module can meet almost any space requirement in users' applications, such as smart phone, PDA, industrial handheld, machine-to-machine and vehicle application, etc.

1.2 Hardware Interface Overview

The interfaces are described in detail in the next chapters include:

- Power Supply
- USB2.0 Interface
- UART Interface
- MMC/SD Interface
- SDIO Interface
- USIM Interface
- SPI Interface
- GPIO
- ADC
- LDO Power Output
- Current Sink Source
- PCM Interface
- SPI Interface
- I2C Interface
- HSIC Interface
- SGMII Interface

1.3 Hardware Block Diagram

The block diagram of the module is shown in the figure below.

1.4 Functional Overview

Table2: General features

Feature	Implementation
Power supply	Single supply voltage 3.4~4.2V, Recommend supply voltage 3.8V
Power saving	Current in sleep mode : <5mA
Radio frequency bands	Please refer to the table 1
Transmitting power	<p>GSM/GPRS power class:</p> <ul style="list-style-type: none"> --GSM850: 4 (33dBm) --EGSM900: 4 (33dBm) --DCS1800: 1 (30dBm) --PCS1900: 1 (30dBm) <p>EDGE power class:</p> <ul style="list-style-type: none"> --GSM850: E2 (27dBm) --EGSM900: E2 (27dBm) --DCS1800: E1 (26dBm) --PCS1900: E1 (26dBm) <p>UMTS power class:</p> <ul style="list-style-type: none"> --WCDMA :3 (24dBm) <p>LTE power class: 3 (24dBm)</p>
Data Transmission Throughput	<p>GPRS multi-slot class 12</p> <p>EDGE multi-slot class 12</p> <p>UMTS R99 speed: 384 kbps DL/UL</p> <p>HSPA+: 5.76 Mbps(UL), 42 Mbps(DL)</p> <p>HSDPA/HSUPA: 2.2 Mbps(UL), 2.8 Mbps(DL)</p> <p>LTE CAT 1: 10 Mbps(DL) 5 Mbps(UL)</p> <p>LTE CAT 4 :150 Mbps (DL) 50 Mbps (UL)</p>
Antenna	<p>GSM/UMTS/LTE main antenna.</p> <p>UMTS/LTE auxiliary antenna</p> <p>GNSS antenna</p>
GNSS	<p>GNSS engine (GPS, GLONASS, BD, QZSS and GALILEO)</p> <p>Protocol: NMEA 0183</p>
SMS	<p>MT, MO, CB, Text and PDU mode</p> <p>SMS storage: USIM card or ME(default)</p> <p>Transmission of SMS alternatively over CS or PS.</p>
USIM interface	Support identity card: 1.8V/ 3V
USIM application toolkit	<p>Support SAT class 3, GSM 11.14 Release 98</p> <p>Support USAT</p>
Phonebook management	Support phonebook types: DC, MC, RC, SM, ME, FD, ON, LD, EN
Audio feature	<p>Support PCM interface</p> <p>Only support PCM master mode and short frame sync, 16-bit linear data formats</p>
UART interface	<p>A full modem serial port by default</p> <p>Baud rate: 300bps to 4Mbps(default:115200bps)</p> <p>Can be used as the AT commands or data stream channel</p> <p>Support RTS/CTS hardware handshake</p>

	Multiplex ability according to GSM 07.10 Multiplexer Protocol
MMC/SD	Support MMC and SD cards with 2.85 V on SD port
SDIO	Support SDIO with 1.8 V only on SDIO port
USB	USB 2.0 high speed interface, Can used be send AT command, Software update, GNSS NMEA,USB voice function etc.
Firmware upgrade	Firmware upgrade over USB interface or FOTA
Physical characteristics	Size:30*30*2.9m Weight:5.7 g
Temperature range	Normal operation temperature: -30°C to +80°C Extended operation temperature: -40°C to +85°C* Storage temperature -45°C to +90°C

NOTE

Module is able to make and receive voice calls, data calls, SMS and make GPRS/UMTS/HSPA+/LTE traffic in -40°C ~ +85°C. The performance will be reduced slightly from the 3GPP specifications if the temperature is outside the normal operating temperature range and still within the extreme operating temperature range.

Table 5: Pin description

Pin name	Pin No.	Default status	Description	Comment
Power supply				
VBAT	38,39, 62,63	PI	Power supply, voltage range: 3.4~4.2V.	
VDD_AUX	44	PO	LDO power output for other external circuits with Max 150mA current output. Its output voltage is 2.85V by default. (The voltage can be configured from 1.7V to 3.05V by AT command) .	If used SGMII function ,this pin used for SGMII function. If unused, keep it open.
VDD_1V8	15	PO	1.8 output with Max 50mA current output for external circuit, such as level shift circuit.	If unused, keep it open.
GND	1,2,5, 10,14,37, 40,41,43, 57,58,60, 61,64,65, 77,78,80, 81,93,98, 110,118,1 20,121,1 22,123,1 24,125,1 26,127,1 28,129,1 30,131,1		Ground

System Control				
PWRKEY	3	DI,PU	System power on/off control input, active low.	The high voltage is 0.8V;
RESET	4	DI, PU	System reset control input, active low.	RESET has been pulled up to 1.8V via 40Kohm resistor internally.
SD interface				
SD_CMD	21	I/O,PD	SDIO command	If unused, keep them open.
SD_DATA0	22	I/O,PD	SDIO data	
SD_DATA1	23	I/O,PD

SD_DET	48	DI,PU	SD card insertion detect H: SD card is removed L: SD card is inserted	
USIM interface				
USIM_DATA	17	I/O,PU	USIM Card data I/O, which has been pulled up via a 10KR resistor to USIM_VDD internally. Do not pull it up or down externally.	All lines of USIM interface should be protected against ESD.
USIM_RST	18	DO,PD	USIM Reset	
USIM_CLK	19	DO,PD	USIM clock	
USIM_VDD	20	PO,PD	Power output for USIM card, its output Voltage depends on USIM card type automatically. Its output current is up to 50mA.	
SPI interface				
SPI_CLK*	6	DO	SPI clock output	Default SPI Optional: BT uart function
SPI_MISO*	7	DI	SPI master in/slave out data	
SPI_MOSI*	8	DO	SPI master out/slave in data	
SPI_CS*	9	DO	SPI chip-select output	
USB				
USB_VBUS	11	AI	Valid USB detection input with 3.0~5.25V detection voltage	
USB_DN	12	AI, AO	Negative line of the differential, bi-directional USB signal.	
USB_DP	13	AI, AO	Positive line of the differential, bi-directional USB signal.	
USB_ID	16	AI	High-speed USB ID input	Keep it open.
SGMII interface				
SGMII_RX_P	112	AI	SGMII receive – positive	If unused, keep them open.
SGMII_RX_M	113	AI	SGMII receive - negative	

SGMII_TX_M	114	AO	SGMII transmit - negative	External 1.5K pull-up resistor from 3.3V/2.5V to MDIO_DATA and 10K pull-up resistor from VDD_1V8 to ETH_INT_N are needed when the Ethernet PHY is connected. If unused, please keep them open.
SGMII_TX_P	115	AO	SGMII transmit- positive	
SGMII_RST_N	108	DO	Ethernet PHY reset	
SGMII_INT_N	109	DI,PU	Ethernet PHY interrupt	
SGMII_MDIO	116	DIO	Management data input/output-data	
SGMII_MDC	117	DO	Management data input/output-clock

2.3 Mechanical Information

The following figure shows the package outline drawing of MODULE.

Figure 3: Dimensions (Unit: mm)

2.4 Footprint Recommendation

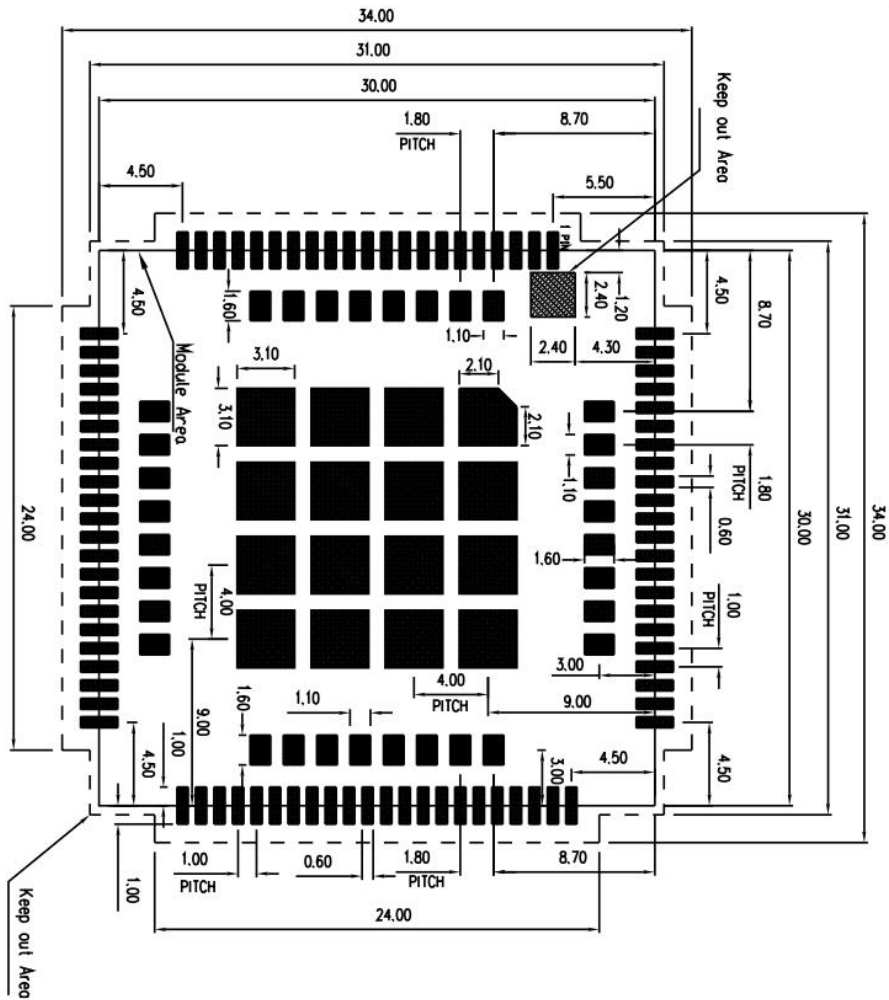

Figure 4: Footprint recommendation (Unit: mm)

3 Interface Application

3.1 Power Supply

The power supply pins of MODULE include 4 pins (pin 62&63, pin 38&39) named VBAT.

The 4 VBAT pads supply the power to RF and baseband circuits directly. On VBAT pads, the ripple current up to 2A typically, due to GSM/GPRS emission burst (every 4.615ms), may cause voltage drop. So the power supply for these pads must be able to provide sufficient current up to more than 2A in order to avoid the voltage drop is more than 300mV.

The following figure shows the VBAT voltage ripple wave at the maximum power transmit phase.

Figure 5: VBAT voltage drop during burst emission (GSM/GPRS)

NOTE

The test condition: The voltage of power supply for VBAT is 3.8V, Cd=100 μ F tantalum capacitor (ESR=0.7 Ω) and Cf=100nF (Please refer to Figure 6—Application circuit).

Table 6: VBAT pins electronic characteristic

Symbol	Description	Min.	Typ.	Max.	Unit
VBAT	Module power voltage	3.4	3.8	4.2	V
I _{VBAT(peak)}	Module power peak current in normal mode.	-	2	-	A
I _{VBAT(average)}	Module power average current in normal mode	Please refer to the table 34			
I _{VBAT(sleep)}	Power supply current in sleep mode				
I _{VBAT(power-off)}	Module power current in power off mode.	-	-	20	μ A

3.1.1 Power Supply Design Guide

Make sure that the voltage on the VBAT pins will never drop below 3.4V, even during a transmit burst, when current consumption may rise up to 2A. If the voltage drops below 3.4V, the RF performance may be affected.

NOTE

If the power supply for VBAT pins can support up to 2A, more than 300uF capacitors are recommended. Otherwise users must use a total of 1000uF capacitors typically, in order to avoid of the voltage drop more than 300mV.

Some multi-layer ceramic chip (MLCC) capacitors (0.1/1uF) with low ESR in high frequency band can be used for EMC.

These capacitors should be put as close as possible to VBAT pads. Also, users should keep VBAT trace on circuit board wider than 2 mm to minimize PCB trace impedance. The following figure shows the recommended circuit.

Recommend Bead for vbat filter are BLM21PG300SN1D and MPZ2012S221A.

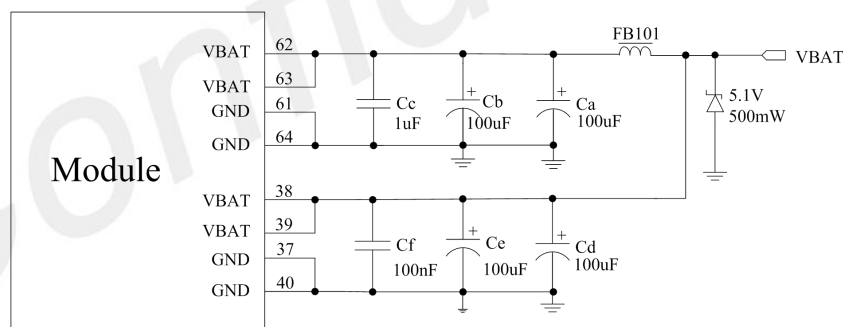

Figure 6: Power supply application circuit

In addition, in order to guard for over voltage protection, it is suggested to use TVS.

NOTE

user could only power pin 62, 63 or only power pin 38, 39, for these pins are connected inside the MODULE.

Table 7: Recommended TVS list

No.	Manufacturer	Part Number	Power dissipation	Package
1	JCET	ESDBW5V0A1	5V	DFN1006-2L
2	WAYON	WS05DPF-B	5V	DFN1006-2L
3	WILLSEMI	ESD5611N	5V	DFN1006-2L
4	WILLSEMI	ESD56151W05	5V	SOD-323
5*	PRISEMI	PESDHC2FD4V5BH	4.5V	DFN1006-2L
6*	WAYON	WS4.5DPV	4.5V	DFN1610-2L

NOTE

If user chooses TVS, please pay attention to Clamping Voltage in your datasheet . For example when the surge input is 100V,the Clamping Voltage is less than 10V.

*If vbat is higher than 3.8V, do not choose NO. 5 and NO. 6.

3.1.2 Recommended Power Supply Circuit

It is recommended that a switching mode power supply or a linear regulator power supply is used. It is important to make sure that all the components used in the power supply circuit can resist a peak current up to 2A.

The following figure shows the linear regulator reference circuit with 5V input and 3.8V output.

Figure 7: Linear regulator reference circuit

If there is a big voltage difference between input and output for VBAT power supply, or the efficiency is

extremely important, then a switching mode power supply will be preferable. The following figure shows the switching mode power supply reference circuit.

Figure 8: Switching mode power supply reference circuit

NOTE

The Switching Mode power supply solution for VBAT must be chosen carefully against Electro Magnetic Interference and ripple current from depraving RF performance.

3.1.3 Voltage Monitor

To monitor the VBAT voltage, the AT command “AT+CBC” can be used.

For monitoring the VBAT voltage outside or within a special range, the AT command “AT+CVALARM” can be used to enable the under-voltage warning function.

If users need to power off MODULE, when the VBAT voltage is out of a range, the AT command “AT+CPMVT” can be used to enable under-voltage power-off function.

Note: Under-voltage warning function and under-voltage power-off function are disabled by default. For more information about these AT commands, please refer to Document [1].

NOTE

Under-voltage warning function and under-voltage power-off function are disabled by default. For more information about these AT commands, please refer to Document [1].

3.2 Power on/Power off/Reset Function

3.2.1 Power on

MODULE can be powered on by pulling the PWRKEY pin down to ground.

The PWRKEY pin has been pulled up with a diode to 1.8V internally, so it does not need to be pulled up externally. It is strongly recommended to put a 100nF capacitor, an ESD protection diode, close to the PWRKEY pin as it would strongly enhance the ESD performance of PWRKEY pin. Please refer to the following figure for the recommended reference circuit.

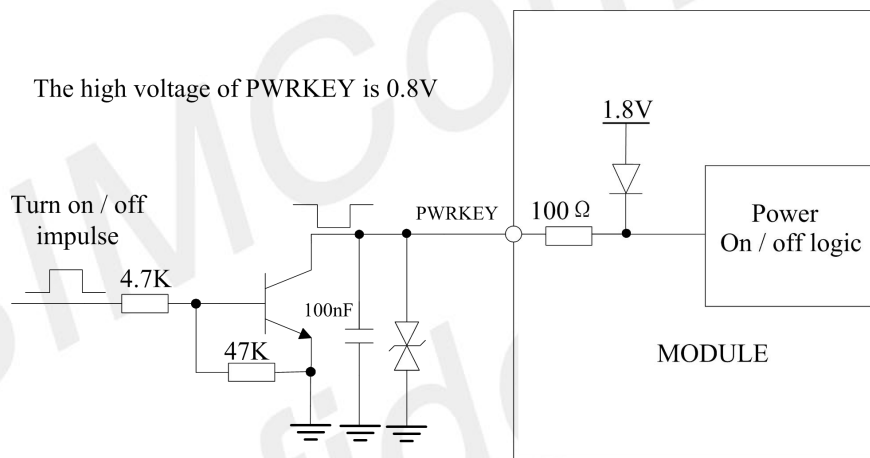

Figure 9: Reference power on/off circuit

NOTE

Module could be automatically power on by connecting PWRKEY pin to ground via 0R resistor directly.

The power-on scenarios are illustrated in the following figure.

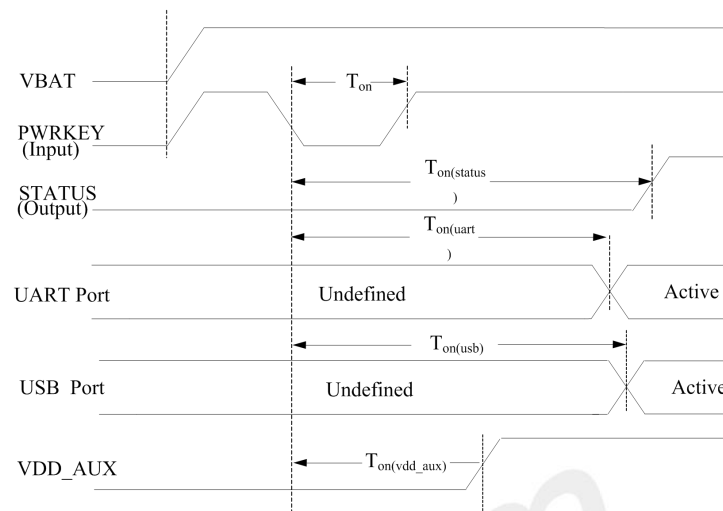

Figure 10: Power on timing sequence

Table 8: Power on timing and electronic characteristic

Symbol	Parameter	Min.	Typ.	Max.	Unit
T_{on}	The time of active low level impulse of PWRKEY pin to power on MODULE	100	500	-	ms
$T_{on(status)}$	The time from power-on issue to STATUS pin output high level(indicating power up ready)	15	16	-	s
$T_{on(uart)}$	The time from power-on issue to UART port ready	13	14	-	s
$T_{on(vdd_aux)}$	The time from power-on issue to VDD_AUX ready		2.5	-	s
$T_{on(usb)}$	The time from power-on issue to USB port ready	11	12	-	s
V_{IH}	Input high level voltage on PWRKEY pin	0.6	0.8	1.8	V
V_{IL}	Input low level voltage on PWRKEY pin	-0.3	0	0.5	V

3.2.2 Power off

The following methods can be used to power off MODULE.

- Method 1: Power off MODULE by pulling the PWRKEY pin down to ground.
- Method 2: Power off MODULE by AT command “AT+CPOF”.
- Method 3: over-voltage or under-voltage automatic power off. The voltage range can be set by AT command “AT+CPMVT”.
- Method 4: over-temperature or under-temperature automatic power off.

NOTE

If the temperature is outside the range of $-30\sim+80^{\circ}\text{C}$, some warning will be reported via AT port. If the temperature is outside the range of $-40\sim+85^{\circ}\text{C}$, MODULE will be powered off automatically.

For details about “AT+CPOF” and “AT+CPMVT”, please refer to Document [1].

These procedures will make MODULE disconnect from the network and allow the software to enter a safe state, and save data before MODULE be powered off completely.

The power off scenario by pulling down the PWRKEY pin is illustrated in the following figure.

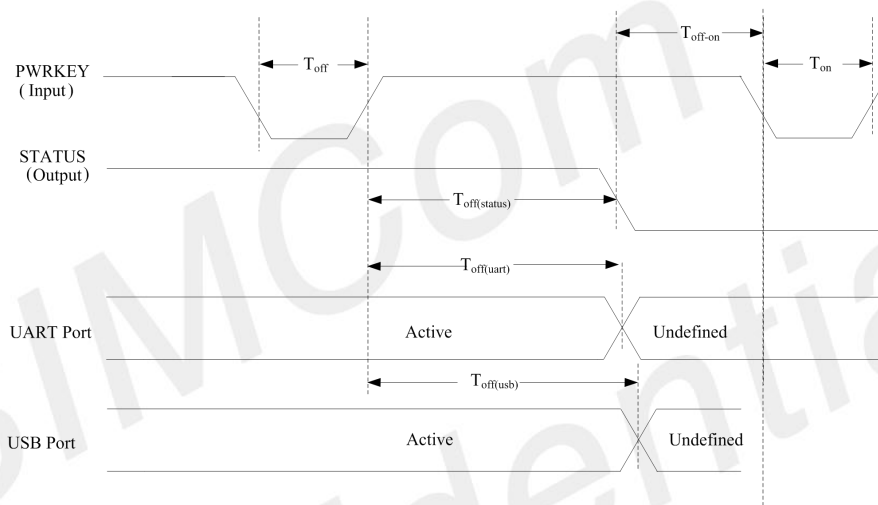

Figure 11: Power off timing sequence

Table 9: Power off timing and electronic characteristic

Symbol	Parameter	Time value			Unit
		Min.	Typ.	Max.	
T_{off}	The active low level time pulse on PWRKEY pin to power off MODULE	--	2.5	--	s
$T_{\text{off(status)}}$	The time from power-off issue to STATUS pin output low level(indicating power off)*	25	26	-	s
$T_{\text{off(uart)}}$	The time from power-off issue to UART port off	14	15	-	s
$T_{\text{off(usb)}}$	The time from power-off issue to USB port off	27	28	-	s
$T_{\text{off-on}}$	The buffer time from power-off issue to power-on issue	0	-	-	s

NOTE

The STATUS pin can be used to detect whether MODULE is powered on or not. When MODULE has

been powered on and firmware goes ready, STATUS will be high level, or else STATUS will still low level.

3.2.3 Reset Function

MODULE can be reset by pulling the RESET pin down to ground.

NOTE

This function is only used as an emergency reset, when AT command “AT+CPOF” and the PWRKEY pin all have lost efficacy.

The RESET pin has been pulled up with a 40KΩ resistor to 1.8V internally, so it does not need to be pulled up externally. It is strongly recommended to put a 100nF capacitor and an ESD protection diode close to the RESET pin. Please refer to the following figure for the recommended reference circuit.

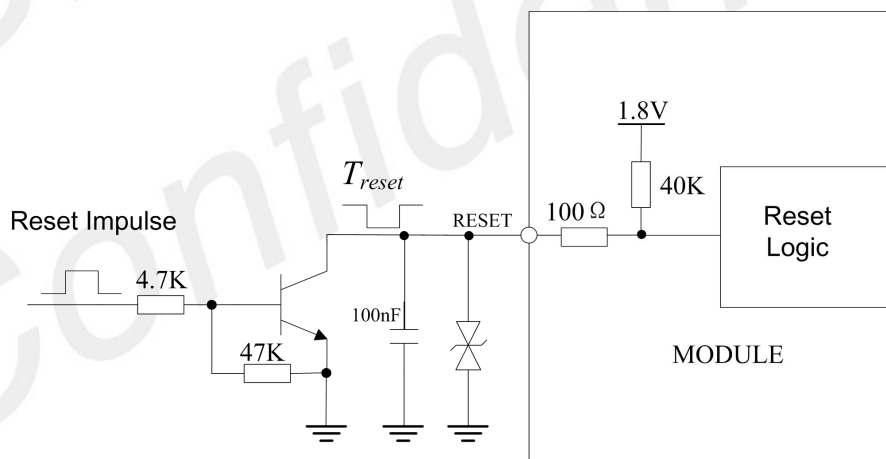

Figure 12: Reference reset circuit

Table 10: RESET pin electronic characteristic

Symbol	Description	Min.	Typ.	Max.	Unit
T_{reset}	The active low level time impulse on RESET pin to reset MODULE	100	200	500	ms
V_{IH}	Input high level voltage	1.17	1.8	2.1	V

V _{IL}	Input low level voltage	-0.3	0	0.8	V
-----------------	-------------------------	------	---	-----	---

3.3 UART Interface

MODULE provides a 7-wire UART (universal asynchronous serial transmission) interface as DCE (Data Communication Equipment). AT commands and data transmission can be performed through UART interface.

3.3.1 UART Design Guide

The following figures show the reference design.

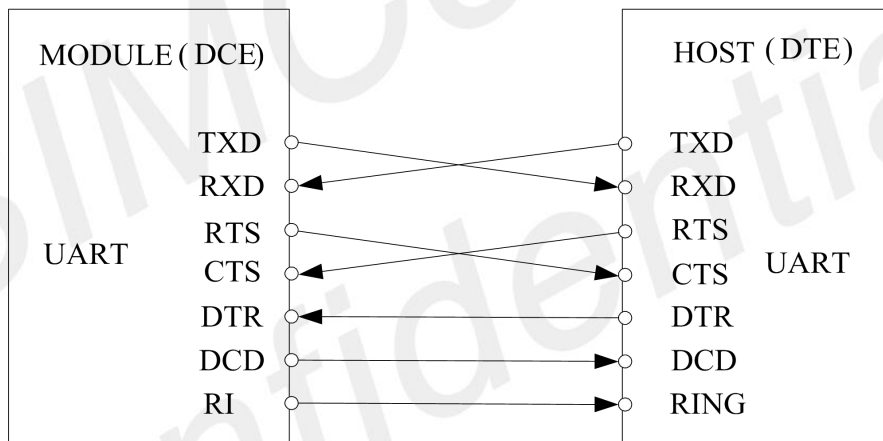

Figure 13: UART full modem

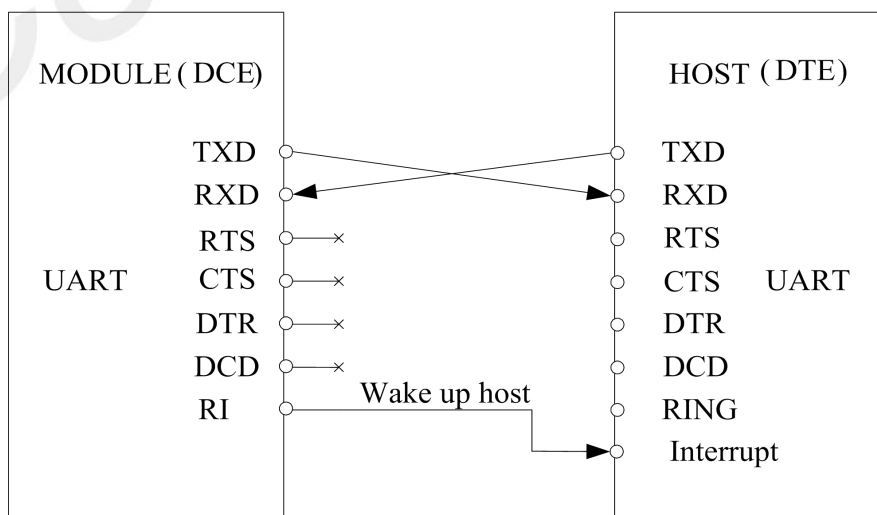

Figure 14: UART null modem

The MODULE UART is 1.8V voltage interface. If user's UART application circuit is 3.3V voltage interface, the level shifter circuits should be used for voltage matching. The TXB0108RGYR provided by Texas Instruments is recommended. The following figure shows the voltage matching reference design.

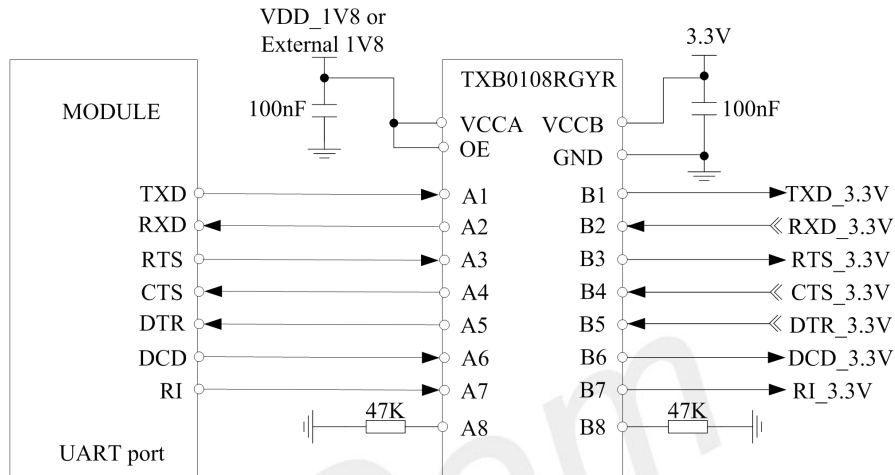

Figure 15: Reference circuit of level shift

User can use another level shifter circuits as follow

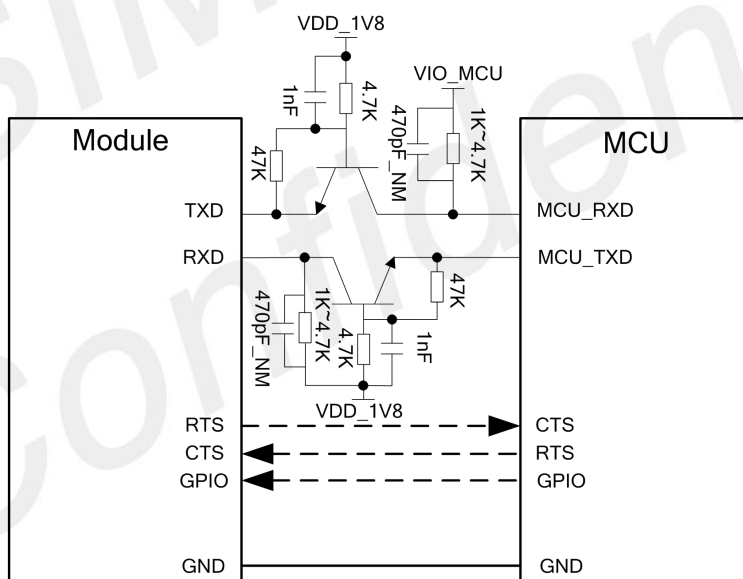

Figure 16: level matching circuit

To comply with RS-232-C protocol, the RS-232-C level shifter chip should be used to connect MODULE to the RS-232-C interface, for example SP3238ECA, etc.

NOTE

User needs to use high speed transistors such as MMBT3904.
 MODULE supports the following baud rates: 300, 600, 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200, 230400, 460800, 921600, 3200000, 3686400, 4000000bps. The default baud rate is 115200bps.

3.3.2 RI and DTR Behavior

The RI pin can be used to interrupt output signal to inform the host controller such as application CPU. Normally RI will keep high level until certain conditions such as receiving SMS, or a URC report coming, and then it will change to low level.

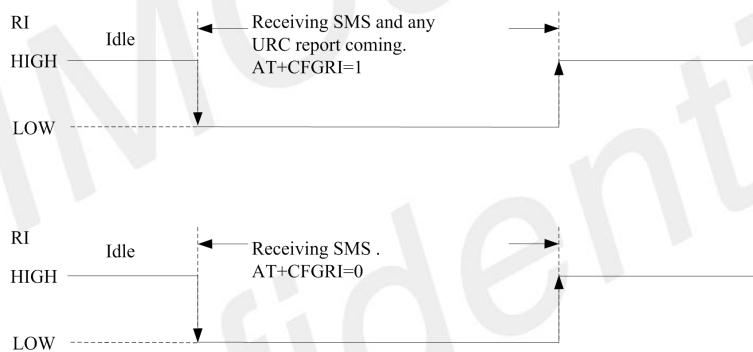

Figure 17: RI behaviour (SMS and URC report)

Normally RI will be kept at a high level until a voice call, then it will output periodic rectangular wave with 5900ms low level and 100ms high level. It will output this kind of periodic rectangular wave until the call is answered or hung up.

Figure 18 : RI behaviour (voice call)

NOTE

For more details of AT commands about UART, please refer to document [1] and [22].

DTR pin can be used to wake MODULE from sleep. When MODULE enters sleep mode, pulling down DTR can wake MODULE.

3.4 USB Interface

The MODULE contains a USB interface compliant with the USB2.0 specification as a peripheral, but the USB charging function is not supported.

MODULE can be used as a USB device. MODULE supports the USB suspend and resume mechanism which can reduce power consumption. If there is no data transmission on the USB bus, MODULE will enter suspend mode automatically, and will be resumed by some events such as voice call, receiving SMS, etc.

Figure 19: USB reference circuit

Because of the high bit rate on USB bus, more attention should be paid to the influence of the junction capacitance of the ESD component on USB data lines. Typically, the capacitance should be less than 1pF. It is recommended to use an ESD protection component such as ESD9L5.0ST5G provided by On Semiconductor (www.onsemi.com).

D3 is suggested to select the diode with anti-ESD and voltage surge function, or user could add a TVS for surge clamping. The recommend TVS please refer to table 7.

NOTE

The USB_DN and USB_DP nets must be traced by 90Ohm+/-10% differential impedance. SIMcom recommend add USB test pads on customer's EVB board for Product Debug.

3.5 HSIC interface

HSIC is a 2-signal source synchronous serial interface which uses 240MHz DDR signaling to provide High-Speed 480Mbps USB transfers which are 100% host driver compatible with traditional USB cable-connected topologies. Full-Speed (FS) and Low-Speed (LS) USB transfers are not directly supported by the HSIC interface (a HSIC enabled hub can provide FS and LS support, as well as IC_USB support)

The differences between HSIC and USB2.0 are listed below:

Table 11: Key differences between HSIC and HS-USB

HSIC	USB2.0
Signal-ended signaling at 1.2 V	Differential signaling
Two signals – STROBE, DATA	Four wires – Ground, D+, D-, VBUS
Double data rate signaling	Data inferred from differential signaling
HS-USB 480 Mbps only	HS/FS/LS support
Maximum trace length of 10 cm	Maximum cable length of 5 m
No HS chirp protocol	HS chirp protocol
Lower power consumption (digital)	Higher power consumption (analog)
No concept of disconnect	Hot plug/play support

module implements a HSIC interface compliant with the HSIC1.0 specification which can be used to connect to the external IC.

NOTE

The module HSIC default work as HSIC to LAN function, if user have any other questions ,please contact simcom for more details.

3.6 SGMII Interface

MODULE provides a SGMII interface with an Ethernet MAC embedded, users could add a PHY to connect to the Ethernet, and the PHY device could be controlled by the MDIO interface and other dedicated signals.

Two Ethernet PHY are supported: AR8031/AR8033 (Qualcomm) and BCM89820 (Broadcom). The AR8031/AR8033 is used for the industrial field and the BCM89820 is dedicated for the automotive field.

Main features of SGMII:

- Ethernet Mac integrated in the module
- IEEE 802.3 Ethernet 10/100/1000Mbps, SGMII IF
- Supports IEEE 1588, Precision Time Protocol (PTP)
- Full duplex rated to 1 Gbps
- Half/full duplex for 10/100 Mbps
- Can be connected to external Ethernet PHY like AR8031/AR8033(industrial 10/100/1000Mbps), BCM89820(automotive 10/100Mbps)
- Uses 8B10B encoding of data with effective baud data rate of 1 Gbps, data rate is always 1.25 Gbps (or DDR clock is always at 625 MHz)

Main features of MDIO:

- Host mode only
- Dual voltage: 1.8 V or 2.85 V operation
- Default signal frequency: 6.25MHz
- MDIO_DATA is OD-gate, and requires an external 1.5 kΩ pull-up resistor to VMDIO.

For the AR8031/AR8033, User should provide 3.3V to power the external Ethernet PHY system and the current should be more than 200mA.

3.6.1 Reference schematic with AR8033

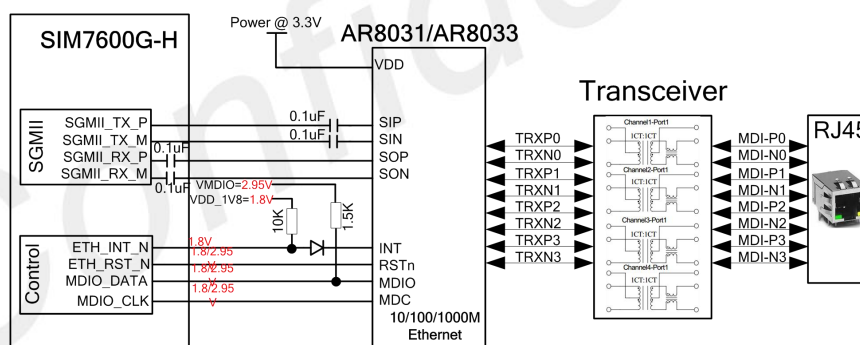

Figure 20: Reference SGMII circuit with AR8033

For the BCM89820, Users should provide 3.3V and 1.2V to power the external Ethernet PHY system and the data interface of PHY. The current of 3.3V and 1.2V should be more than 100mA and 150mA.

3.6.2 Reference schematic with BCM89820

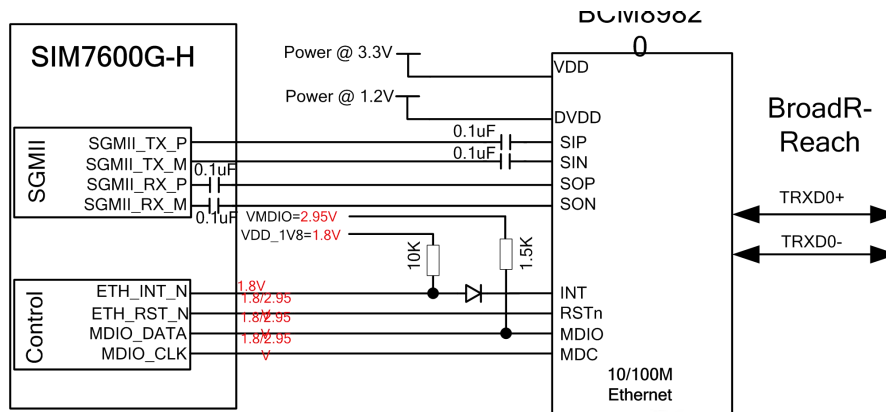

Figure 21: Reference SGMII circuit with BCM89820

NOTE

The module SGMII function default closed. If user need, please contact SIMCom for more details or refer to [document \[28\]](#)

3.7 USIM Interface

MODULE supports both 1.8V and 3.0V USIM Cards.

Table 12: USIM electronic characteristic in 1.8V mode (USIM_VDD=1.8V)

Symbol	Parameter	Min.	Typ.	Max.	Unit
USIM_VDD	LDO power output voltage	1.75	1.8	1.95	V

3.7.1 USIM Application Guide

It is recommended to use an ESD protection component such as ESDA6V1W5 produced by ST (www.st.com) or SMF15C produced by ON SEMI (www.onsemi.com). Note that the USIM peripheral circuit should be close to the USIM card socket. The following figure shows the 6-pin SIM card holder reference circuit.

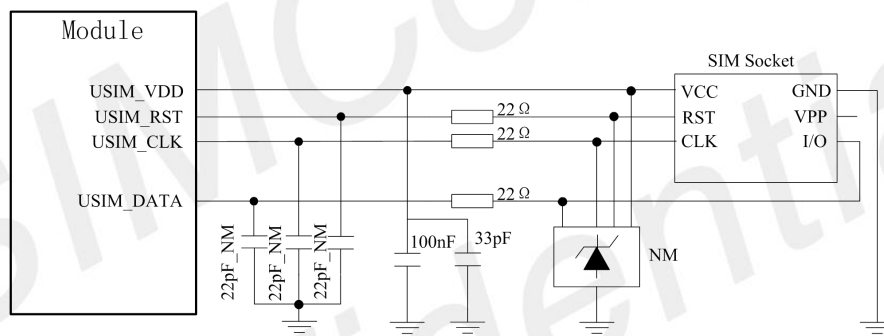

Figure 22: USIM interface reference circuit

NOTE

USIM_DATA has been pulled up with a 10KΩ resistor to USIM_VDD in MODULE. A 100nF capacitor on USIM_VDD is used to reduce interference. For more details of AT commands about USIM, please refer to document [1]. USIM_CLK is very important signal, the rise time and fall time of USIM_CLK should be less than 40ns, otherwise the USIM card might not be initialized correctly.

The USIM_DET pin is used for detection of the USIM card hot plug in. User can select the 8-pin USIM card holder to implement USIM card detection function.

The following figure shows the 8-pin SIM card holder reference circuit.

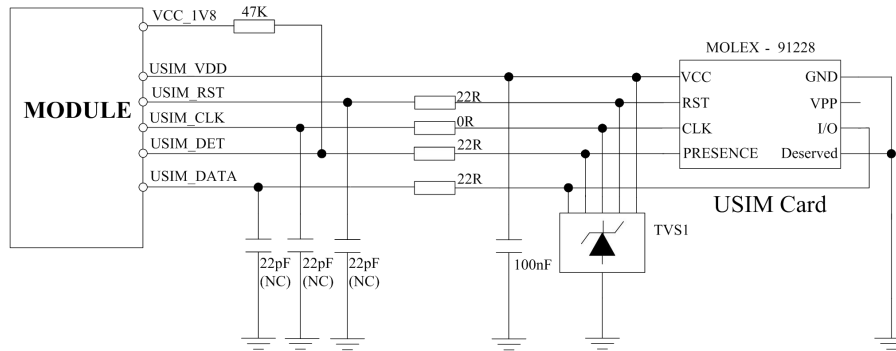

Figure 23: USIM interface reference circuit with USIM_DET

If the USIM card detection function is not used, user can keep the USIM_DET pin open.

SIM card circuit is susceptible, the interference may cause the SIM card failures or some other situations, so it is strongly recommended to follow these guidelines while designing:

- Make sure that the SIM card holder should be far away from the antenna while in PCB layout.
- SIM traces should keep away from RF lines, VBAT and high-speed signal lines.
- The traces should be as short as possible.
- Keep SIM holder's GND connect to main ground directly.
- Shielding the SIM card signal by ground.
- Recommended to place a 0.1~1uF capacitor on USIM_VDD line and keep close to the holder.
- The rise/fall time of USIM_CLK should not be more than 40ns.
- Add some TVS and the parasitic capacitance should not exceed 60pF.

Recommended USIM Card Holder

It is recommended to use the 6-pin USIM socket such as C707 10M006 512 produced by Amphenol. User can visit <http://www.amphenol.com> for more information about the holder.

Figure 24: Amphenol SIM card socket

NOTE

For more details about PCM AT commands, please refer to document [1].

3.8.1 PCM timing

MODULE supports 2.048 MHz PCM data and sync timing for 16 bits linear format codec.

3.8.2 PCM Application Guide

The following figure shows the external codec reference design.

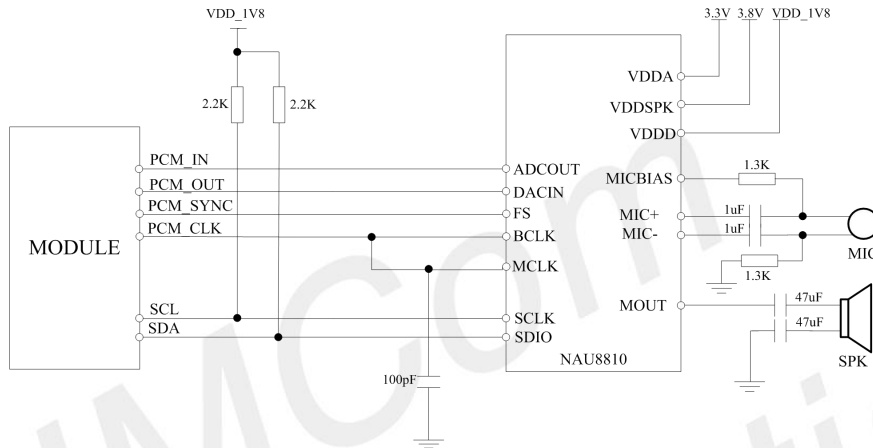

Figure 28: Audio codec reference circuit

3.9 SD Interface

MODULE provides a 4-bit SD/MMC/eMMC interface with clock rate up to 200 MHz.

When connected to a SD or MMC card, the voltage of SD interface is 1.8/2.85V, which is compatible with Secure Digital Physical Layer Specification version 3.0 and SDIO Card Specification version 3.0. It supports up to 128GB SD cards.

When connected to a eMMC card, the interface voltage will be a single 1.8V, which is compatible with eMMC Specification, version 4.5. It supports up to 128GB eMMC cards.

Table 17: SD/MMC electronic characteristic as 2.85V (SD_DATA0-3, SD_CLK and SD_CMD)

Symbol	Parameter	Min.	Typ.	Max.	Unit
V _{IH}	High-level input voltage	0.65*2.85	-	2.85+0.3	V
V _{IL}	Low-level input voltage	-0.3	0	0.25*2.85	V
V _{OH}	High-level output voltage	0.75*2.85	2.85	2.85	V
V _{OL}	Low-level output voltage	0	0	0.15*2.85	V

Table 18: SD/MMC/eMMC electronic characteristic as 1.8V (SD_DATA0-3, SD_CLK and SD_CMD)

Symbol	Parameter	Min.	Typ.	Max.	Unit
V _{IH}	High-level input voltage	0.7*1.8	-	1.8+0.2	V
V _{IL}	Low-level input voltage	-0.3	0	0.3*1.8	V
V _{OH}	High-level output voltage	1.8-0.4	1.8	1.8	V
V _{OL}	Low-level output voltage	0	0	0.45	V

Users should provide 2.85V to power SD card system and the current should more than 350mA, which is showed below as VCC_SD. ESD/EMI components should be arranged beside SD card socket. Refer to the following application circuit.

Figure 29: SD reference circuit

Users should provide 2.85V to power eMMC card system and 1.8V to power the SDIO_DATA/CMD/CLK signals. The source of 2.85V should be able to provide more than 500mA* which showed below as VCC_eMMC, as the source of 1.8V should be able to provide more than 300mA* which showed below as VCCQ_1V8. ESD/EMI components should be arranged close to the eMMC card. Refer to the following application circuit.

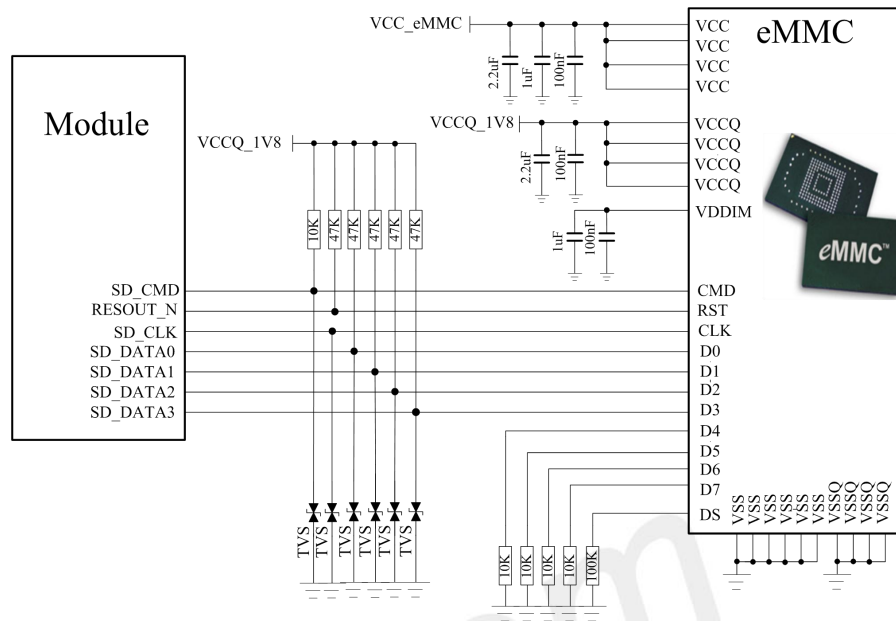

Figure 30: eMMC reference circuit

NOTE

For the current of VCC_eMMC and VCCQ_1V8, users should better refer to the related datasheet of eMMC which is used. The listed current of 500mA and 300mA are just for your reference.

SD/MMC/eMMC card layout guide lines:

- Protect SD card signals from noisy signals (clocks, SMPS, etc.).
- Up to 200 MHz clock rate, 50 Ω nominal, ±10% trace impedance
- CLK to DATA/CMD length matching < 1 mm
- Total routing length < 50 mm
- Spacing to all other signals = 2x line width
- Bus capacitance < 10 pF

3.10 I2C Interface

MODULE provides a I2C interface compatible with I2C specification, version 5.0, with clock rate up to 400 kbps. Its operation voltage is 1.8V.

The following figure shows the I2C bus reference design.

Figure 31: I2C reference circuit

NOTE

SDA and SCL do not have pull-up resistors in MODULE. So, 2 external pull up resistors are needed in application circuit.

“AT+CR1IC and AT+CW1IC” AT commands could be used to read/write register values of the I2C peripheral devices. For more details about AT commands please refer to document [1].

3.11 SDIO Interface

MODULE provides a 4 bit 1.8V SDIO interface for WLAN solution with W58 module.

The SDIO interface can be used for WLAN solution.

NOTE

Special software version for CAT4 MODULEs supports this function.

3.12 SPI Interface

Module provides a SPI interface as a master only. It provides a duplex, synchronous, serial communication

link with peripheral devices. Its operation voltage is 1.8V, with clock rates up to 50 MHz

NOTE

For more details of the AT commands about the SPI, please refer to document [1].

3.13 Network status

The NETLIGHT pin is used to control Network Status LED, its reference circuit is shown in the following figure.

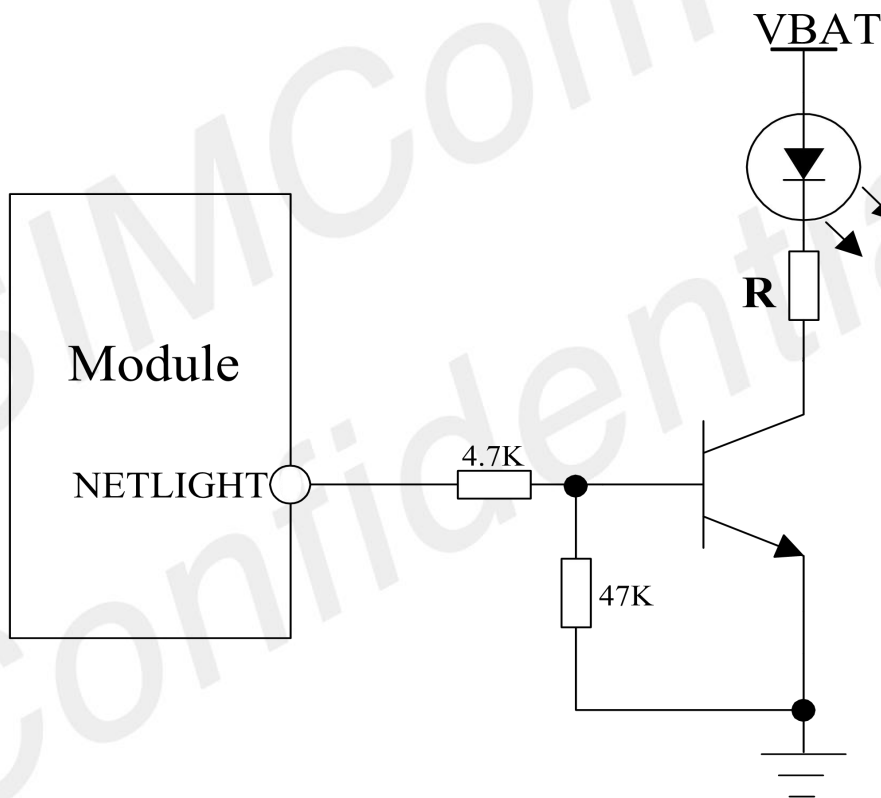

Figure 32: NETLIGHT reference circuit

NOTE

The value of the resistor named “R” depends on the LED characteristic.

Table 19: NETLIGHT pin status

NETLIGHT pin status	Module status
Always On	Searching Network; Call Connect(include VOLTE,SRLTE)

200ms ON, 200ms OFF	Data Transmit; 4G registered;
800ms ON, 800ms OFF	2G/3G registered network
OFF	Power off ;Sleep

NOTE

NETLIGHT output low level as “OFF”, and high level as “ON”.

3.14 Flight Mode Control

The FLIGHTMODE pin can be used to control MODULE to enter or exit the Flight mode. In Flight mode, the RF circuit is closed to prevent interference with other equipments and minimize current consumption. Bidirectional ESD protection component is suggested to add on FLIGHTMODE pin, its reference circuit is shown in the following figure.

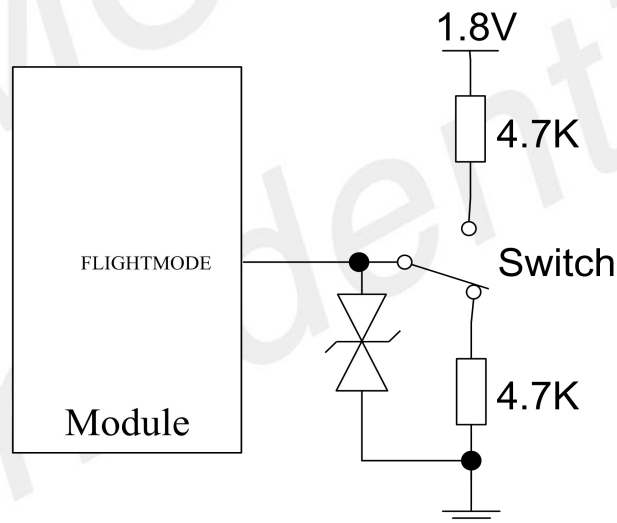

Figure 33: Flight mode switch reference circuit

Table 20: FLIGHTMODE pin status

FLIGHTMODE pin status	Module operation
Input Low Level	Flight Mode: RF is closed
Input High Level	AT+CFUN=0: RF is closed AT+CFUN=1:RF is working

3.15 Other interface

3.15.1 Sink Current Source

The ISINK pin is VBAT tolerant and intended to drive some passive devices, such as LCD backlight and white LED, etc. Its output current can be up to 40mA and be set by the AT command “AT+ CLEDITST”.

Table 21: Sink current electronic characteristic

Symbol	Description	Min.	Typ.	Max.	Unit
V_{ISINK}	Voltage tolerant	0.5	-	VBAT	V
I_{ISINK}	Current tolerant	0	-	40	mA

ISINK is a ground-referenced current sink. The following figure shows its reference circuit.

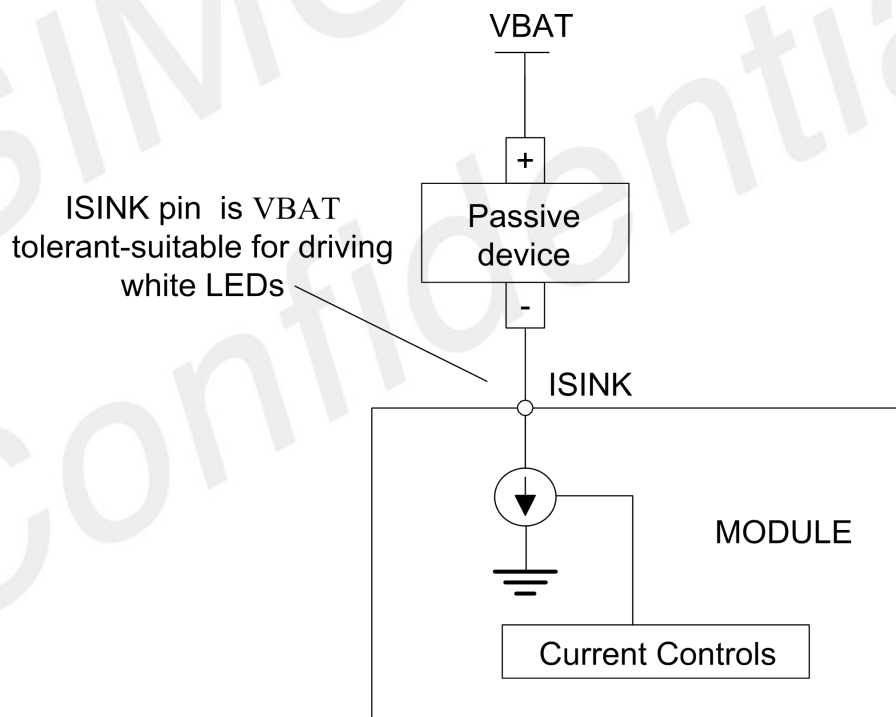

Figure 34: ISINK reference circuit

NOTE

The sinking current can be adjusted to meet the design requirement through the AT command “AT+ CLEDITST =<0>, <value>”. The “value” ranges from 0 to 8, on behalf of the current from 0mA to 40mA by 5mA step.

3.15.2 ADC

MODULE has 2 dedicated ADC pins named ADC1 and ADC2. They are available for digitizing analog signals such as battery voltage and so on. These electronic specifications are shown in the following table.

Table 22: ADC1 and ADC2 electronic characteristics

Characteristics	Min.	Typ.	Max.	Unit
Resolution	–	15	–	Bits
Conversion time	–	442	–	ms
Input Range	0.1		1.7	V
Input serial resistance	1	–	–	MΩ

NOTE

“AT+CADC” and “AT+CADC2” can be used to read the voltage of the ADC1 and ADC2 pins, for more details, please refer to document [1].

3.15.3 LDO

MODULE has a LDO power output, named VDD_AUX. its output voltage is 2.85V by default, Users can switch the LDO on or off by the AT command “AT+CVAUXS” and configure its output voltage by the AT command “AT+CVAUXV”.

Table 23: Electronic characteristic

Symbol	Description	Min.	Typ.	Max.	Unit

4.2. GSM /UMTS/LTE Antenna Design Guide

Users should connect antennas to MODULE's antenna pads through micro-strip line or other types of RF trace and the trace impedance must be controlled in 50Ω. SIMCom recommends that the total insertion loss between the antenna pads and antennas should meet the following requirements:

Table 29: Trace loss

Frequency	Loss
700MHz-960MHz	<0.5dB
1710MHz-2170MHz	<0.9dB
2300MHz-2650MHz	<1.2dB

To facilitate the antenna tuning and certification test, a RF connector and an antenna matching circuit should be added. The following figure is the recommended circuit.

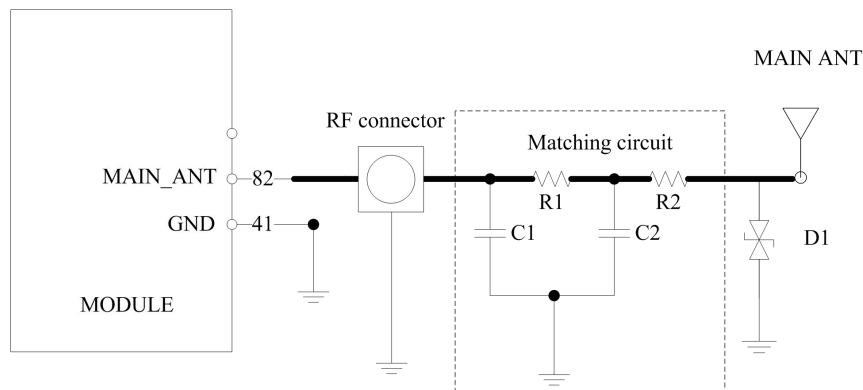

Figure 35: Antenna matching circuit (MAIN_ANT)

In above figure, the components R1, C1, C2 and R2 are used for antenna matching, the values of components can only be achieved after the antenna tuning and usually provided by antenna vendor. By default, the R1, R2 are 0Ω resistors, and the C1, C2 are reserved for tuning. The component D1 is a TVS for ESD protection, and it is optional for users according to application environment.

The RF test connector is used for the conducted RF performance test, and should be placed as close as to the MODULE's MAIN_ANT pin. The traces impedance between MODULE and antenna must be controlled in 50Ω.

Figure 36: Antenna matching circuit (AUX_ANT)

In above figure, R3, C3, C4 and R4 are used for auxiliary antenna matching. By default, the R3, R4 are 0Ω resistors, and the C3, C4 are reserved for tuning. D2 is a TVS for ESD protection, and it is optional for users according to application environment.

Two TVS are recommended in the table below.

Table 30: Recommended TVS

Package	Part Number	Vender
0201	LXES03AAA1-154	Murata

0402

LXES15AAA1-153

Murata

NOTE

SIMCom suggests the LTE auxiliary antenna to be kept on, since there are many high bands in the designing of LTE-TDD, such as band38, band40 and band41. Because of the high insert loss of the RF cable and layout lines, the receiver sensitivity of these bands above will have risk to meet the authentication without the diversity antenna. For more details about auxiliary antenna design notice, please refer to document [25].

4.3. GNSS

MODULE merges GNSS (GPS/GLONASS/BD) satellite and network information to provide a high-availability solution that offers industry-leading accuracy and performance. This solution performs well, even in very challenging environmental conditions where conventional GNSS receivers fail, and provides a platform to enable wireless operators to address both location-based services and emergency mandates.

4.3.1 GNSS Technical specification

- Tracking sensitivity: -159 dBm (GPS) /-158 dBm (GLONASS) /-159 dBm (BD)
- Cold-start sensitivity: -148 dBm
- Accuracy (Open Sky): 2.5m (CEP50)
- TTFF (Open Sky) : Hot start <1s, Cold start<35s
- Receiver Type: 16-channel, C/A Code
- GPS L1 Frequency: 1575.42±1.023MHz
- GLONASS: 1597.5~1605.8 MHz
- BD: 1559.05~1563.14 MHz
- Update rate: Default 1 Hz
- GNSS data format: NMEA-0183
- GNSS Current consumption : 100mA (GSM/UMTS/LTE Sleep ,in total on VBAT pins)
- GNSS antenna: Passive/Active antenna

NOTE

If the antenna is active type, the power should be given by main board because there is no power supply on the GPS antenna pad. If the antenna is passive, it is suggested that the external LNA should be used.

4.3.2 GNSS Application Guide

Users can adopt an active antenna or a passive antenna to MODULE. If using a passive antenna, an external LNA is a must to get better performance.

The following figures are the reference circuits.

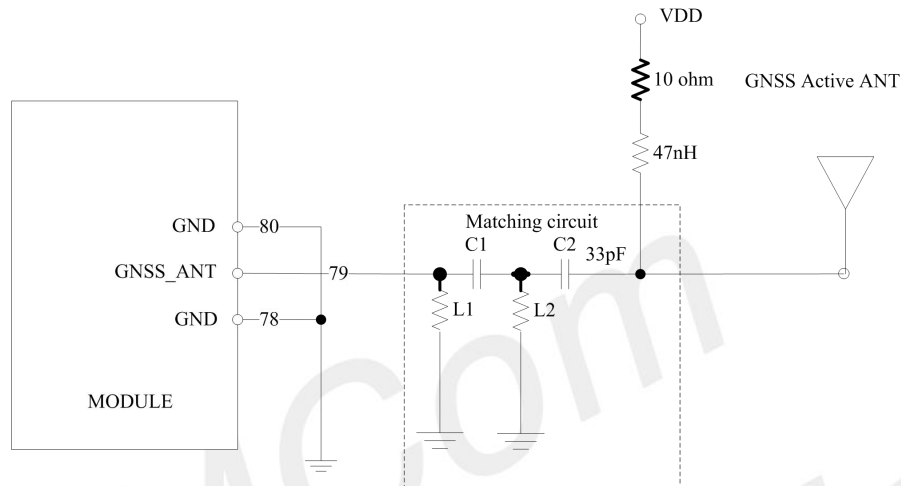

Figure 37: Active antenna circuit

Figure 38: Passive antenna circuit (Default)

In above figures, the components C1, L1 and L2 are used for antenna matching. Usually, the values of the components can only be achieved after antenna tuning and usually provided by antenna vendor. C2 is used for DC blocking. L3 is the matching component of the external LNA, and the value of L3 is determined by the LNA characteristic and PCB layout. Both VDD of active antenna and V_LNA need external power supplies which should be considered according to active antenna and LNA characteristic. LDO/DCDC is recommended to get lower current consuming by shutting down active antennas and LNA when GNSS is not working.

GNSS can be tested by NMEA port. NMEA sentences can be obtained through UART or USB automatically. NMEA sentences include GSV, GGA, RMC, GSA, and VTG. Before using GNSS, user should configure MODULE in proper operating mode by AT command. Please refer to related documents for details. MODULE can also get position location information through AT directly.

Note: GNSS is closed by default and can be started by AT+CGPS. The AT command has two parameters,

the first is on/off, and the second is GNSS mode. Default mode is standalone mode. AGPS mode needs more support from the mobile telecommunication network. Please refer to document [24] for more details.

5 Electrical Specification

5.1 Absolute maximum ratings

Absolute maximum rating for digital and analog pins of MODULE are listed in the following table:

Table 31: Absolute maximum ratings

Parameter	Min.	Typ.	Max.	Unit
Voltage at VBAT	-0.5	-	6.0	V
Voltage at USB_VBUS	-0.5	-	5.85	V
Voltage at digital pins (RESET,SPI,Keypad,GPIO,I2C,UART,PCM)	-0.3	-	2.1	V
Voltage at digital pins (SD,USIM)	-0.3	-	3.05	V
Voltage at PWRKEY	-0.3	-	1.8	V

5.2 Operating conditions

Table 32: Recommended operating ratings

Parameter	Min.	Typ.	Max.	Unit
Voltage at VBAT	3.4	3.8	4.2	V
Voltage at USB_VBUS	3.0	5.0	5.25	V

Table 33: 1.8V Digital I/O characteristics*

Parameter	Description	Min.	Typ.	Max.	Unit
V _{IH}	High-level input voltage	1.17	1.8	2.1	V
V _{IL}	Low-level input voltage	-0.3	0	0.63	V
V _{OH}	High-level output voltage	1.35	-	1.8	V
V _{OL}	Low-level output voltage	0	-	0.45	V

I _{OH}	High-level output current(no pull down resistor)	-	2	-	mA
I _{OL}	Low-level output current(no pull up resistor)	-	-2	-	mA
I _{IH}	Input high leakage current (no pull down resistor)	-	-	1	uA
I _{IL}	Input low leakage current(no pull up resistor)	-1	-	-	uA

NOTE

These parameters are for digital interface pins, such as SPI, GPIOs (NETLIGHT, FLIGHTMODE, STATUS, USIM_DET, SD_DET), SDIO, I2C, UART, PCM, COEXn, and BOOT_CFG0.

The operating temperature of MODULE is listed in the following table.

Table 34: Operating temperature

Parameter	Min.	Typ.	Max.	Unit
Normal operation temperature	-30	25	80	°C
Extended operation temperature*	-40	25	85	°C
Storage temperature	-45	25	+90	°C

NOTE

Module is able to make and receive voice calls, data calls, SMS and make GSM/ UMTX/LTE traffic in -40 °C ~ +85 °C . The performance will be reduced slightly from the 3GPP specifications if the temperature is outside the normal operating temperature range and still within the extreme operating temperature range.

5.3 Operating Mode

5.3.1. Operating Mode Definition

The table below summarizes the various operating modes of MODULE product.

Table 35: Operating mode Definition

Mode		Function
Normal operation	GSM /UMTS/LTE Sleep	In this case, the current consumption of MODULE will be reduced to the minimal level and the MODULE can still receive paging message and SMS.
	GSM/UMTS/LTE Idle	Software is active. Module is registered to the network, and the MODULE is ready to communicate.
	GSM/UMTS/LTE Talk	Connection between two subscribers is in progress. In this case, the power consumption depends on network settings such as DTX off/on, FR/EFR/HR, hopping sequences, and antenna.
	GPRS/EDGE/UMTS/LTE Standby	Module is ready for data transmission, but no data is currently sent or received. In this case, power consumption depends on network settings.
	GPRS/EDGE/UMTS/LTE Data transmission	There is data transmission in progress. In this case, power consumption is related to network settings (e.g. power control level); uplink/downlink data rates, etc.
Minimum functionality mode		AT command “AT+CFUN=0” AT+CSCLK=1 can be used to set the MODULE to a minimum functionality mode without removing the power supply. In this mode, the RF part of the MODULE will not work and the USIM card will not be accessible, but the serial port and USB port are still accessible. The power consumption in this mode is lower than normal mode.
Flight mode		AT command “AT+CFUN=4” or pulling down the FLIGHTMODE pin can be used to set the MODULE to flight mode without removing the power supply. In this mode, the RF part of the MODULE will not work, but the serial port and USB port are still accessible. The power consumption in this mode is lower than normal mode.
Power off		Module will go into power off mode by sending the AT command “AT+CPOF” or pull down the PWRKEY pin, normally. In this mode the power management unit shuts down the power supply, and software is not active. The serial port and USB are is not accessible.

5.3.2. Sleep mode

In sleep mode, the current consumption of MODULE will be reduced to the minimal level, and MODULE can still receive paging message and SMS.

Several hardware and software conditions must be satisfied together in order to let MODULE enter into sleep mode:

1. UART condition
2. USB condition

3. Software condition

NOTE

Before designing, pay attention to how to realize sleeping/waking function and refer to Document [26] for more details.

5.3.3. Minimum functionality mode and Flight mode

Minimum functionality mode ceases a majority function of MODULE, thus minimizing the power consumption. This mode is set by the AT command which provides a choice of the functionality levels.

- AT+CFUN=0: Minimum functionality
- AT+CFUN=1: Full functionality (Default)
- AT+CFUN=4: Flight mode

If MODULE has been set to minimum functionality mode, the RF function and USIM card function will be closed. In this case, the serial port and USB are still accessible, but RF function and USIM card will be unavailable.

If MODULE has been set to flight mode, the RF function will be closed. In this case, the serial port and USB are still accessible, but RF function will be unavailable.

When MODULE is in minimum functionality or flight mode, it can return to full functionality by the AT command "AT+CFUN=1".

5.4 Current Consumption

The current consumption is listed in the table below.

5.5 ESD Notes

MODULE is sensitive to ESD in the process of storage, transporting, and assembling. When MODULE is mounted on the users' mother board, the ESD components should be placed beside the connectors which human body may touch, such as USIM card holder, audio jacks, switches, keys, etc. The following table shows the MODULE ESD measurement performance without any external ESD component.

Table 37: The ESD performance measurement table (Temperature: 25°C, Humidity: 45%)

Part	Contact discharge	Air discharge
VBAT,GND	+/-5K	+/-10K
Antenna port	+/-4K	+/-8K
Other PADS	+/-0.5K	+/-1K

6.3 Typical SMT Reflow Profile

SIMCom provides a typical soldering profile. Therefore the soldering profile shown below is only a generic recommendation and should be adjusted to the specific application and manufacturing constraints.

Figure 41: The ramp-soak-spike reflow profile of MODULE

NOTE

For more details about secondary SMT, please refer to the document [21].

6.4 Moisture Sensitivity Level (MSL)

MODULE is qualified to Moisture Sensitivity Level (MSL) 3 in accordance with JEDEC J-STD-033. If the prescribed time limit is exceeded, users should bake MODULE for 192 hours in drying equipment (<5% RH) at 40+5/-0°C, or 72 hours at 85+5/-5°C. Note that plastic tray is not heat-resistant, and only can be baked at 45° C.

Table 39: Moisture Sensitivity Level and Floor Life

Moisture Sensitivity Level (MSL)	Floor Life (out of bag) at factory ambient ≤30°C/60% RH or as stated
1	Unlimited at ≤30°C/85% RH
2	1 year
2a	4 weeks
3	168 hours
4	72 hours
5	48 hours
5a	24 hours
6	Mandatory bake before use. After bake, it must be reflowed within the time limit specified on the label.

NOTE

IPC / JEDEC J-STD-033 standard must be followed for production and storage.

6.5 Stencil Foil Design Recommendation

The recommended thickness of stencil foil is more than 0.15mm.

8.4 Safety Caution

Table 46: Safety Caution

Marks	Requirements
	When in a hospital or other health care facility, observe the restrictions about the use of mobiles. Switch the cellular terminal or mobile off, medical equipment may be sensitive and not operate normally due to RF energy interference.
	Switch off the cellular terminal or mobile before boarding an aircraft. Make sure it is switched off. The operation of wireless appliances in an aircraft is forbidden to prevent interference with communication systems. Forgetting to think much of these instructions may impact the flight safety, or offend local legal action, or both.
	Do not operate the cellular terminal or mobile in the presence of flammable gases or fumes. Switch off the cellular terminal when you are near petrol stations, fuel depots, chemical plants or where blasting operations are in progress. Operation of any electrical equipment in potentially explosive atmospheres can constitute a safety hazard.

Your cellular terminal or mobile receives and transmits radio frequency energy while switched on. RF interference can occur if it is used close to TV sets, radios, computers or other electric equipment.

Road safety comes first! Do not use a hand-held cellular terminal or mobile when driving a vehicle, unless it is securely mounted in a holder for hands free operation. Before making a call with a hand-held terminal or mobile, park the vehicle.

GSM cellular terminals or mobiles operate over radio frequency signals and cellular networks and cannot be guaranteed to connect in all conditions, especially with a mobile fee or an invalid SIM card. While you are in this condition and need emergent help, please remember to use emergency calls. In order to make or receive calls, the cellular terminal or mobile must be switched on and in a service area with adequate cellular signal strength.

Some networks do not allow for emergency call if certain network services or phone features are in use (e.g. lock functions, fixed dialing etc.). You may have to deactivate those features before you can make an emergency call.

Also, some networks require that a valid SIM card be properly inserted in the cellular terminal or mobile.
