1. Introduction

This document describes the electronic specifications, RF specifications, interfaces, mechanical characteristics and test results of the SIM8300G-M2 module. With the help of this document, customers can quickly understand SIM8300G-M2 module.

Associated with other software application notes and user guides, customers can use SIM8300G-M2 to design and develop mobile and laptop applications easily.

1.1 Product Outline

SIM8300G-M2 is a wireless communication module focusing on 5G market. It supports multi-air access technology including 5G NR FR1 and FR2, LTE, and WCDMA, can meet the 3GPP R15 NR specification. The millimeter-wave feature is implemented with Qualcomm's millimeter-wave antenna module QTM525 or QTM527, QTM525 is for general application such as MiFi, and QTM527 is for high power application such as HP CPE.

The module's supported radio frequency bands are shown in the following table.

Table 1: SIM8300G-M2 frequency bands

Standard	Frequency bands
5G mmwave	QTM525-2: n257/n261 and n258
	QTM525-5: n258, n260, and n257/n261

GNSS ²	GPS L1+L5 dual bands/GLONASS/BeiDou/Galileo/QZSS

NOTE

1. Please confirm with SIMCom for the details information about the combination of ENDC.
2. GNSS is optional.

The physical dimension of SIM8300G-M2 is 30.0mm*52.0mm*3.65mm, which can meet PCI Express M.2 specifications, and can meet almost all space requirements in customer's applications.

With M.2 Type 3052, SIM8300G-M2 owns rich interfaces, includes USB3.1, PCIe3.0, (U)SIM card, digital audio (I2S or PCM), I2C, GPIOs, four antennas for 3G/4G/5G and GNSS.

With all the interfaces, SIM8300G-M2 can also be utilized in the handheld terminal, machine-to-machine laptop application and especially the notebook.

1.2 Hardware Block Diagram

The block diagram of SIM8300G-M2 is shown in the following figure.

1.3 Feature Overview

Table 2: Key features

Feature	Implementation
Power supply ¹	VBAT: 3.135~4.4V Typical: 3.8V
Power consumption*	5mA@sleep mode(VBAT=3.8V, AT+CFUN=0)*
Transmit power	Power Class 1 for 5G mmWave (with QTM527) Power Class 3 for 5G mmWave (with QTM525) Power Class 3 for WCDMA/LTE/5G NR Power Class 2 for n41/n78/n79
Data transmission throughput	7Gbps (DL)/ 3Gbps (UL) for 5G mmWave 4Gbps (DL)/ 1Gbps (UL) for 5G Sub-6G 2Gbps (DL)/200Mbps (UL) for LTE 42Mbps(DL)/5.76Mbps(UL) for HSPA+
Antenna	Six antennas for 3G/4G/5G and GNSS Eight IF interfaces ports for mmWave antenna module interconnection
GNSS(optional)	GNSS engine : GPS L1+L5/GLONASS/BeiDou/Galileo/QZSS Protocol: NMEA
SMS	MT, MO, CB, Text and PDU mode SMS storage: (U)SIM card or ME(default) Transmission of SMS alternatively over CS or PS
(U)SIM interface	Support (U)SIM card:1.8V/3.0V Include (U)SIM1 and e-SIM(internal of module) interfaces
(U)SIM application toolkit	Support SAT class 3 Support USAT
Phonebook management	Support phonebook types: DC,MC,RC,SM,ME,FD,ON,LD,EN One I2S interface with dedicated main-clock for primary digital audio, the I2S also can be configured as PCM
Digital audio interface	● MCLK frequency: 12.288MHz (default) ● WCDMA AMR-NB ● VoLTE AMR-WB ● Echo Cancellation ● Noise Suppression
PCIe interface	● One lane PCIe interface, support Gen 3 (Gen 1/2 compatible) ● High communication data rate which up to 8Gbps
I2C interface	● Meet I2C specification, version 5.0 ● Data rate up to 400Kbps
USB interface	Support USB 3.1 Gen2 USB3.1: super speed, with data rate which up to 10Gbps

	USB2.0: high speed interface, support USB operations at low-speed and full-speed, which refer to USB1.0 and USB1.1
UART interface	SIM8300G-M2 hardware configures as normal communication (AT command) UART by default
Firmware upgrade	Firmware upgrade over USB interface
Physical characteristics	Size: 30mm*52mm*3.65mm Weight: TBD
Temperature range	Normal operation temperature: -30°C to +70°C (3GPP compliant) Extended operation temperature: -40°C to +85°C ³ Storage temperature: -40°C to +90°C

NOTE

1. The recommended operating voltage of the module is 3.8V. If the voltage is lower than 3.3V, the RF performance may deviate from the 3GPP specifications.
2. “*” means under development.
3. The module is able to establish and maintain voice, data transmission, SMS and emergency call, etc. The performance may deviate slightly from the 3GPP specifications and will meet 3GPP specifications again when the temperature returns to normal operating temperature levels.

2. Package Information

2.1 Pin Assignment Overview

SIM8300G-M2 has 75 pins, including 8 notch pins. Customer design should match pins functions. The following figure is the pin assignment of the module.

3. The RFFE signals are multiplexed with ANTCTL3 and ANTCTL4.

2.3 Mechanical Dimensions

The following figure shows the mechanical dimensions of SIM8300G-M2.

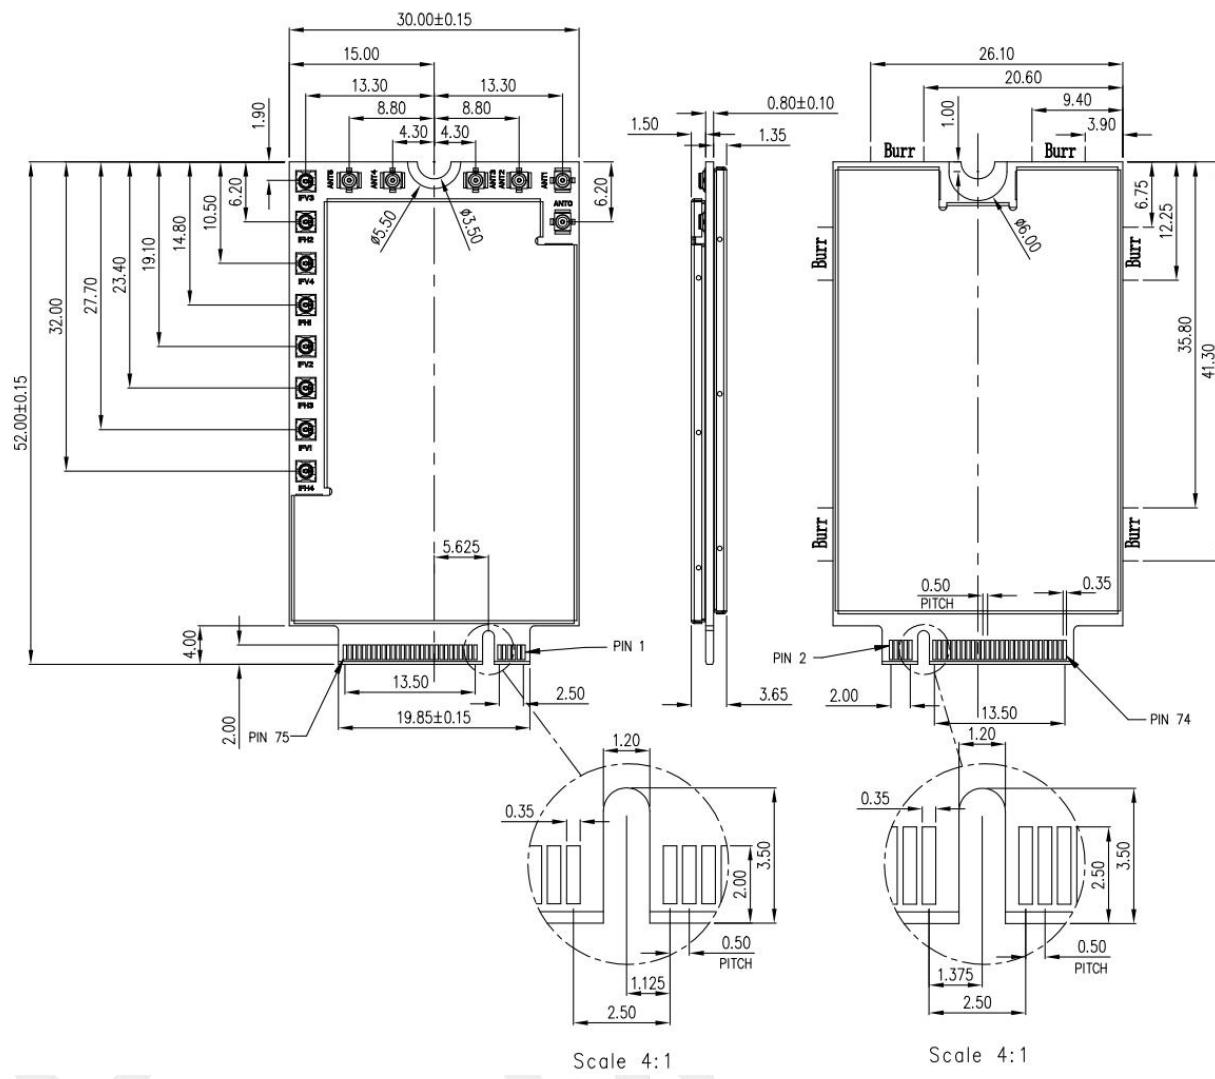

Figure 3: Dimensions of the module (unit: mm)

3. Interface Application

3.1 Power Supply

The recommended power supply of SIM8300G-M2 is 3.8V and the voltage ranges from 3.135 V to 4.4 V. Please make sure that the input voltage will never drop below 3.135V, otherwise the module will be powered off automatically. The module has 5 power pins and 11 ground pins. To ensure the module works properly, all pins should be connected.

Table 6: VBAT pins electrical characteristics*

Symbol	Description	Min.	Typ.	Max.	Unit
VBAT	Module power supply voltage	3.135	3.8	4.4	V
I _{Peak}	Peak current	-	-	TBD	A
I _{Sleep}	Current in sleep mode(AT+CFUN=0)	-	5	-	mA
I _{Leakage}	Current in power off mode	-	50	-	uA

3.1.1 Power Supply Design Guide*

When the module transmits at the maximum power, the peak current will be very high which results in voltage dropping on VBAT. To ensure that the voltage is no less than required 3.135V, the external power supply current capability must be enough. The following figure shows the maximum voltage drop during the maximum power radio transmission.

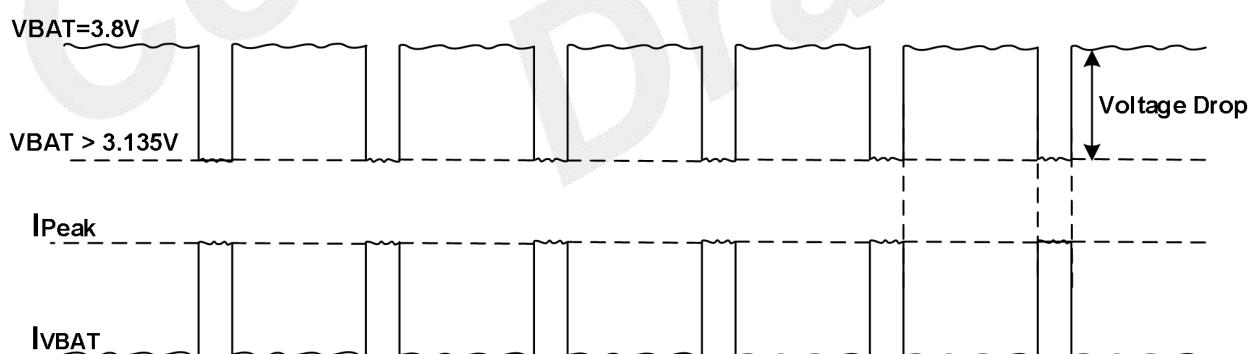

Figure 4: VBAT voltage drop at the maximum power radio transmission

NOTE

1. The total capacitors of VBAT net are not less than 420uF.

To decrease the voltage dropping, make sure that the capacitors of VBAT net must not less than 420uF. The following figure shows the reference circuit of power supply for the VBAT.

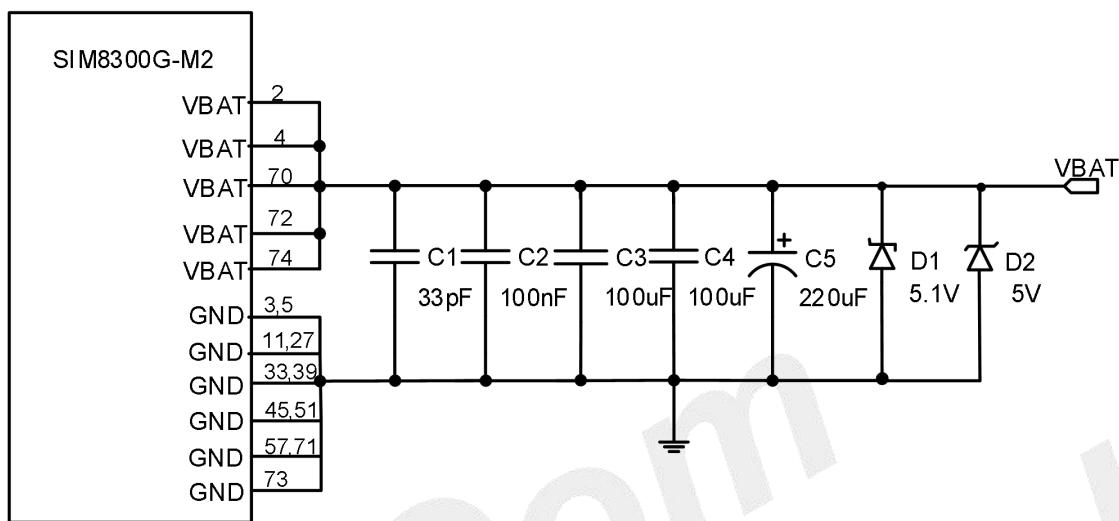

Figure 5: Power supply reference circuit

Table 7: Definition of VBAT and GND pins

Pin name	Pin no.	Electrical description	Description	Comment
VBAT	2,4,70,72, 74	PI	Power supply Range : 3.135~4.4V Typical : 3.8V	These pins should be connected together to withstand sufficient current
GND	3,5,11,27, 33,39,45,51 ,57,71,73		Ground	

In this reference circuit, some multi-layer ceramic chip (MLCC) capacitors (0.1/1uF) with low ESR in high frequency band can be used for EMI suppression.

These capacitors should be put as close as possible to VBAT pins. Also, users should keep VBAT trace on circuit board wider than 3.0mm to minimize PCB trace impedance.

NOTE

1. C5 is 220 μ F tantalum capacitor, ESR=0.7 Ω .
2. C1 and C2 are multi-layer ceramic chip (MLCC) capacitors from 33pF to 1uF with low ESR in high frequency band, which can be used for EMC performance.
3. D2 is used for ESD protection and D1 is used for surge protection.

Table 8: Recommended D1 and D2 list

No.	Manufacturer	Part number	VRWM	Package	Ref. Designator
1	JCET	ESDBW5V0A1	5V	DFN1006-2L	D2
2	WAYON	WS05DPF-B	5V	DFN1006-2L	
3	LRC	LEDZ5.1BT1G	5.1V	SOD-523	D1
4	Prisemi	PZ5D4V2H	5.1V	SOD-523	

Power supply layout guidelines:

- Both VBAT and return trace should be as short and wide as possible to minimize the voltage drop.
- The width of VBAT trace cannot be less than 3.0mm.
- These capacitors should be placed as closely as possible with VBAT pins.
- The VBAT trace should pass through TVS diode, zener diode and capacitors, and then VBAT pins. The capacitor of the small value should be placed close to VBAT pins.
- The PCB design must have a solid ground plane as the primary reference plane for most signals.

3.1.2 Recommended Power Supply Circuit

It is recommended to use a switching mode power supply. Make sure it can provide current be large enough.

The switching mode power output need to divide BB power supply and RF mmw antenna power supply.

Figure 6 shows the switching mode power supply reference circuit with 12V input and 3.8V output.

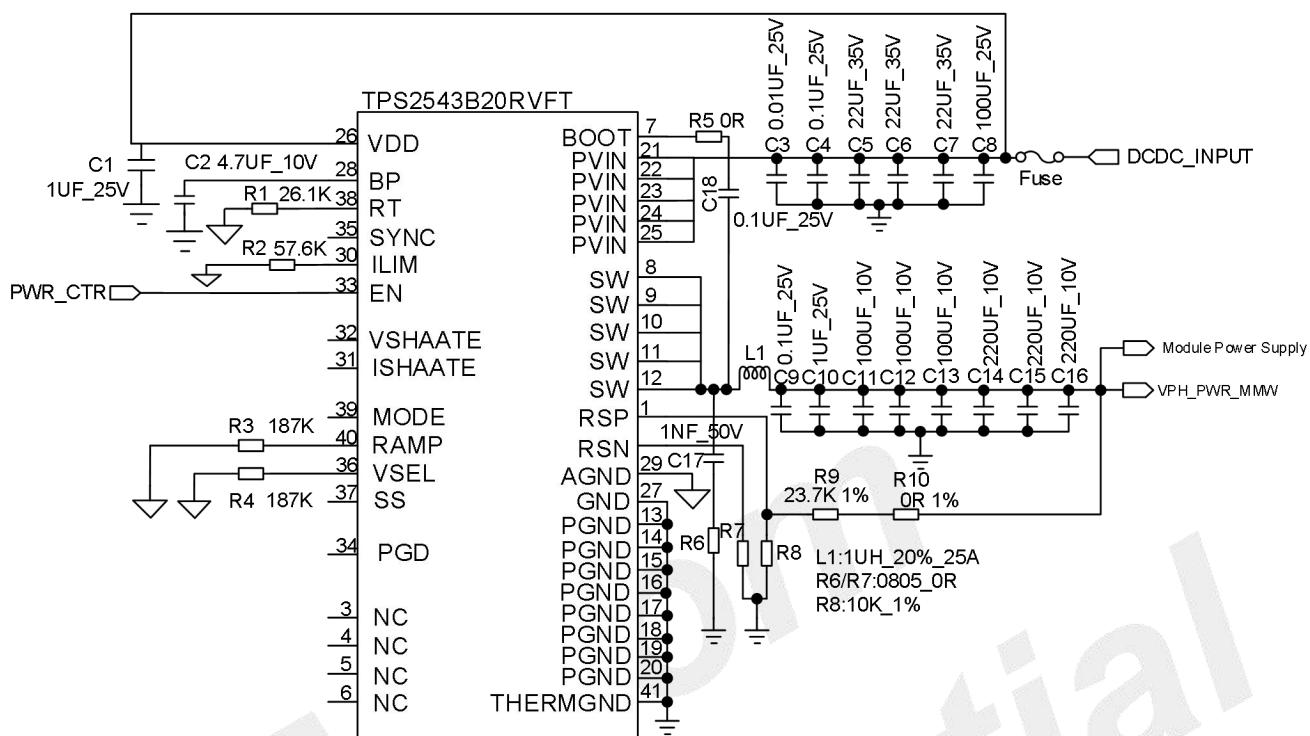

Figure 6: Switching mode power supply reference circuit

NOTE

1. In order to avoid damaging the module, please do not switch off the power supply when module works normally. Only after the module is shut down by FULL_CARD_POWER_OFF# or AT command, then the power supply can be cut off.
2. It is suggested that customer's design should have the ability to switch off the power supply for module in abnormal state, and then switch on the power to restart the module.
3. The PWR_CTRL signal recommend connect to the host and can be controlled.
4. The power adapter use 12V 8A at least.

3.1.3 Voltage Monitor

To monitor the VBAT voltage, the AT command “AT+CBC” can be used.

NOTE

For the details about voltage monitor commands, please refer to [Document \[1\]](#) in the appendix.

3.2 Power On and Off Module

Driving the FULL_CARD_POWER_OFF# pin to a high level, SIM8300G-M2 will be powered on. It can be driven by either 1.8V or 3.3V GPIO. The following figure shows the power on/off circuit.

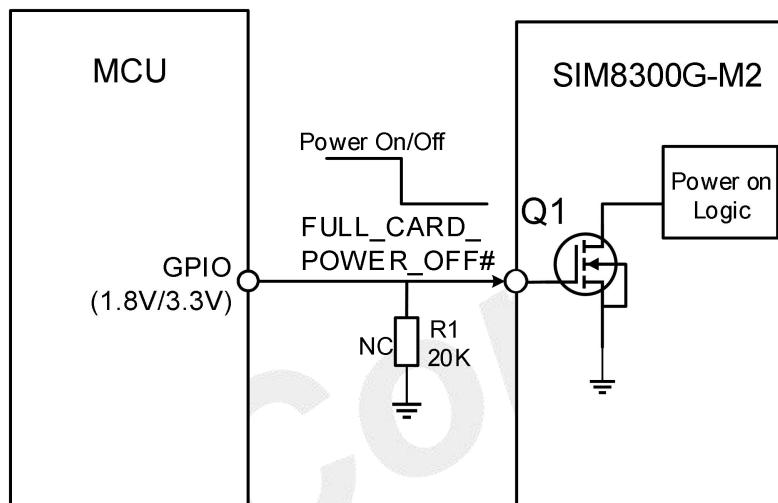

Figure 7: Reference power on/off circuit

Table 9: Definition of FULL_CARD_POWER_OFF# pin

Pin name	Pin no.	Electrical description	Description	Comment
FULL_CARD_POWER_OFF#	6	DI,PD	High level: the module powers on Low level: the module powers off	It's 3.3V tolerant but can be driven by either 1.8V or 3.3V GPIO

NOTE

After the module enter force download mode, the FULL_CARD_POWER_OFF# signal need to release and don't pull high always. If not, the module will restart and then cause the download fail.

3.2.1 Power On

The power on sequence is shown in the following figure.

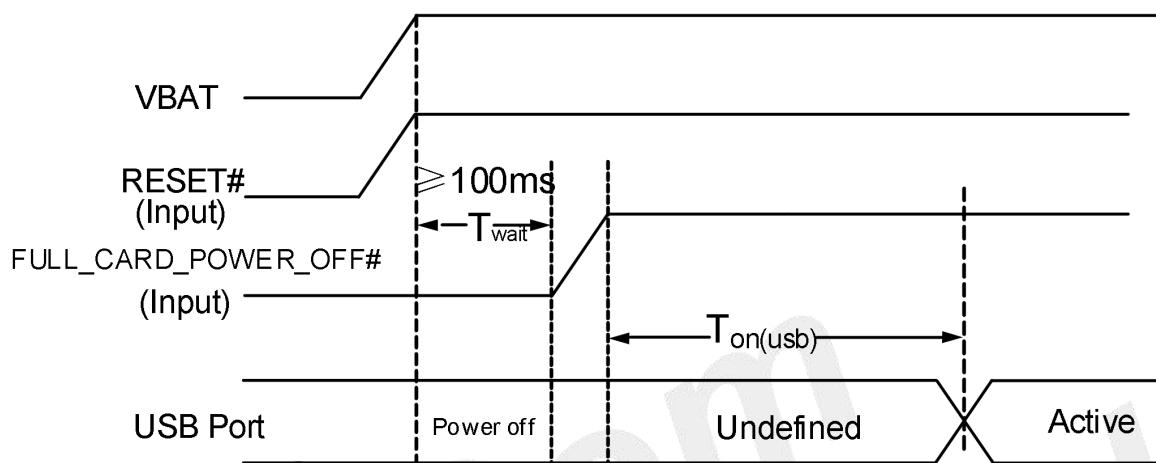

Figure 8: Power on sequence

Table 10: Power on timing and electrical characteristics

Symbol	Parameter	Min.	Typ.	Max.	Unit
T_{wait}	The waiting time from power supply available to power-on action	100	-	-	ms
$T_{on(usb)}$	The time from power-on action to USB port ready	-	12	-	s
V_{IH}	Input high level voltage on FULL_CARD_POWER_OFF# pin	1.2	1.8	4.4	V
V_{IL}	Input low level voltage on FULL_CARD_POWER_OFF# pin	0	-	0.2	V

NOTE

After the module is shut down, please wait at least 12 seconds before turning off the power, and then power on the module.

3.2.2 Power Off

The following methods can be used to power off the module.

- Method 1: Power off the module by holding the FULL_CARD_POWER_OFF# pin to low level.
- Method 2: Power off the module by AT command “AT+CPOF”.

NOTE

1. If the temperature is outside the range of $-30^{\circ}\text{C} \sim +70^{\circ}\text{C}$, some warning will be reported via AT port. If the temperature is outside the range of $-40^{\circ}\text{C} \sim +85^{\circ}\text{C}$, module will be powered off automatically. For the details about “AT+CPOF”, please refer to [Document \[1\]](#) in the appendix.
2. When the module is powered off by AT command, if the power supply and FULL_CARD_POWER_OFF# are not shut down, the module will automatically power on again.

Above normal power-off action will make the module disconnect from the network, allow the software to enter a safe state, and save key data before the module is powered off completely.

The power off sequence is shown in the following figure.

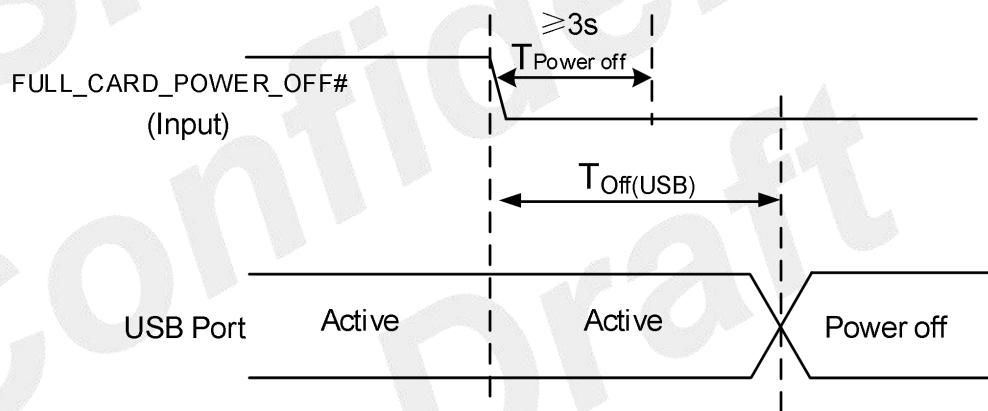

Figure 9: Power off sequence

Table 11: Power off timing and electrical characteristics

Symbol	Parameter	Time value			Unit
		Min.	Typ.	Max.

$T_{\text{Power off}}$	The time holding the FULL_CARD_POWER_OFF# pin to low level for the module into power off status	-	3	-	s

3.3 Reset Function

SIM8300G-M2 can be reset by driving the RESET# pin down to a low level.

The RESET# signal has been internally pulled up to 1.8V, so it does not need pull up externally. Please refer to the following figure for the recommended reference circuit.

3.4 I2C Interface

SIM8300G-M2 supports an I2C interface meet I2C specification version 5.0, with data rate up to 400kbps.

The following figure shows the I2C interface reference circuit.

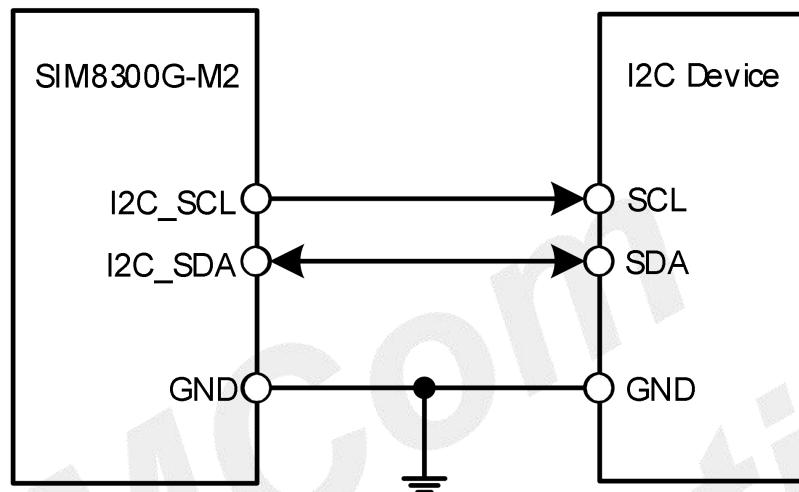

Figure 12: I2C reference circuit

3.5 WoWWAN#*

The WoWWAN# pin is a system wake-on signal which can be used as an interrupt signal for the host. Normally it keeps high level. And it will change to low level when certain conditions occur, such as receiving SMS, voice call (CSD, video) or URC reporting, the low level pulse time is 1 second.

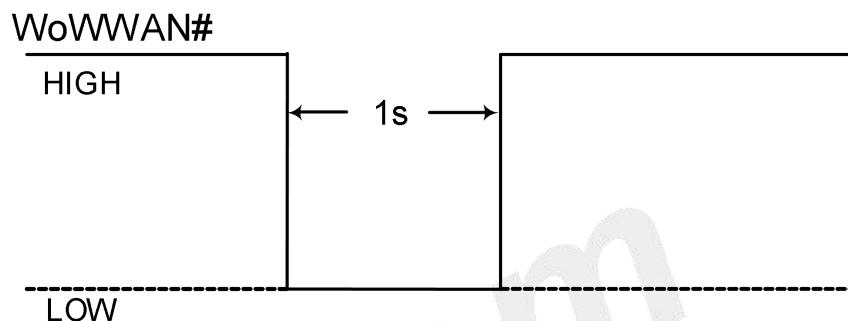

Figure 13: WoWWAN# signal level at SMS and URC report

WoWWAN# recommended reference circuit is shown in the following figure.

3.6 USB Interface

SIM8300G-M2 supports one USB interface which complies with the USB3.1 and 2.0 specifications. Customers can choose USB3.1 or USB2.0 for their needs. USB 3.1 data rate up to 10Gbps.

The USB interface is used for AT command communication, data transmission, GNSS NMEA output, firmware upgrade and software debugging.

The module supports USB suspend and resume mechanism which can save power consumption. If there is no data transmission on the USB bus, the module will enter suspend mode automatically.

The following figure is the USB reference circuit.

USB HS D+/D- layout guidelines:

- Require differential trace impedance is $90\pm10\% \Omega$.
- The intra-lane length mismatch of the differential signal lanes is less than 1mm.
- Gap from other signals keeps 3xline width.
- External components should be placed near the USB connector.
- Trace routes away from other sensitive signals (RF, audio, and 38.4M XO).
- The TVS diode should be placed close to the USB pins of M.2 connector.
- Maximum PCB trace length can't exceed 100mm out of the module, the shorter trace and more better.

USB SS TX/RX layout guidelines:

- Require differential trace impedance is $90\pm10\% \Omega$.
- The intra-lane length mismatch of the differential signal lanes is less than 500um.
- Gap from other signals keeps 4xline width.
- Gap between Rx-to-Tx keeps 4xline width.
- External components should be placed near the USB connector.
- Trace routes away from other sensitive signals (RF, especially 2.4 GHz).
- The TVS diode should be placed close to the USB pins of M.2 connector.
- Route differential pairs in the inner layers with a solid GND reference to have good impedance control and to minimize discontinuities.
- Keep isolation between the Tx pair, Rx pair, and DP/DM to avoid crosstalk.
- If core vias are used, use no more than two core vias per signal line to limit stubs.

3.7 PCIe Interface

SIM8300G-M2 supports PCIe Gen3 one lane interfaces, which data rate up to 8Gbps, and can be used as EP or RC* mode. CLKREQ# and PEWAKE# needs pull up to 3.3V by 100K resistor in customer's design. The following figure is the PCIe reference circuit.

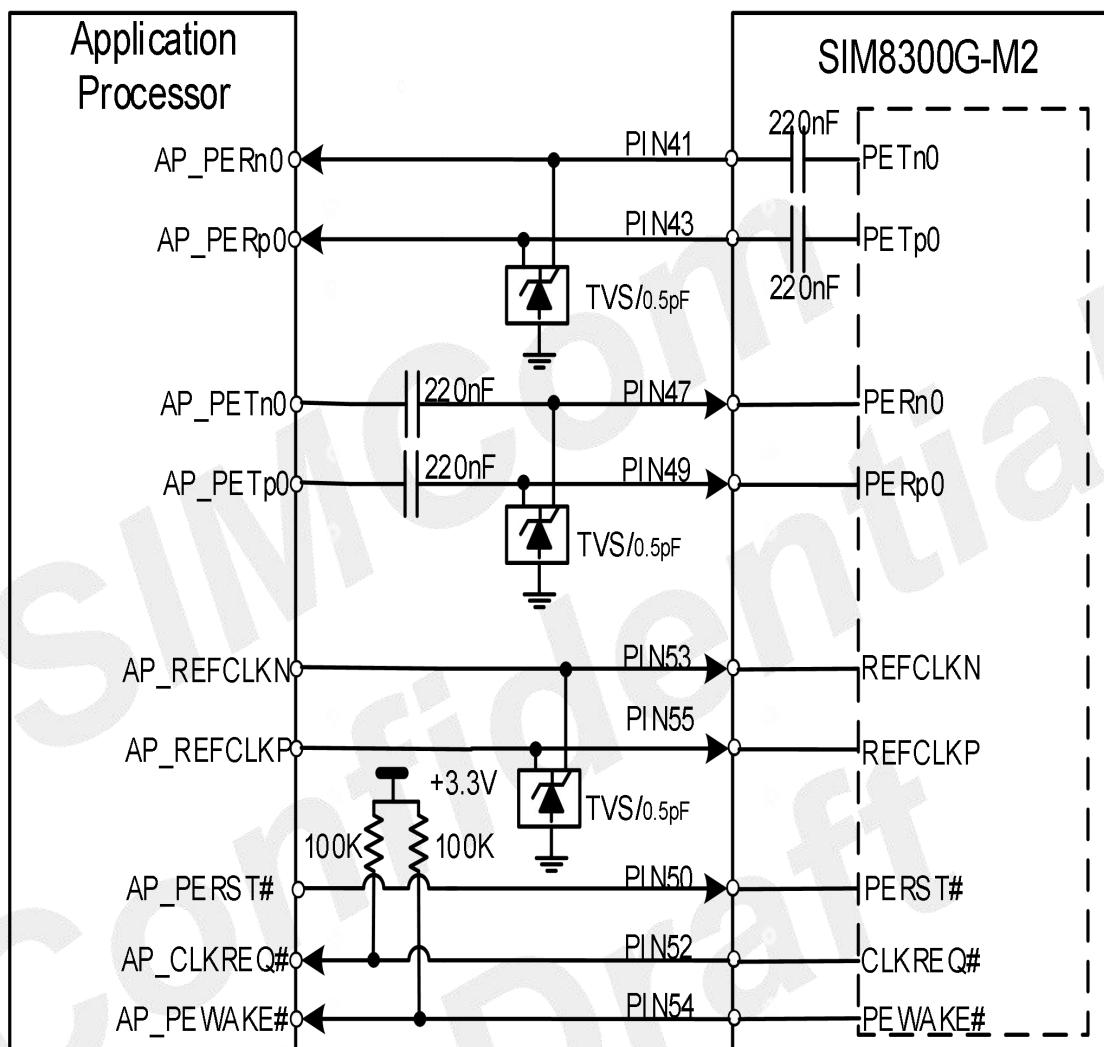

Figure 17: PCIe interface reference circuit (EP Mode)

NOTE

PCIe interface layout guidelines:

- Require differential trace impedance is $90 \pm 10\% \Omega$.
- The intra-lane length mismatch of the differential signal lanes is less than 500um.
- Gap from other signals keeps 4xline width.
- Gap between Rx-to-Tx keeps 4xline width.
- Should be routed away from sensitive signals.
- The TVS diode should be placed close to the PCIe pins of M.2 connector.
- All other sensitive/high-speed signals and circuits must be protected from PCIe corruption.
- PCIe signals must be protected from noisy signals (clocks, SMPS).
- Each trace needs to be adjacent to a ground plane.
- Maximum PCB trace length can't exceed 150mm out of the module, the shorter trace and more better.

3.8 (U)SIM Interface

SIM8300G-M2 supports dual-voltage 1.8V or 3.0V (U)SIM1 cards or e-(U)SIM (internal of the module) card, the size is 2mm*2mm*1mm of the e-(U)SIM.

NOTE

Customers choose the e-(U)SIM products according to the above size, SIMCom will provide the e-(U)SIM assemble into the module, for more details please contact SIMCom support teams.

The module supports (U)SIM card hot-swap by the (U)SIM_DET pin, which is a level trigger pin. The (U)SIM_DET pin pulled up internally.

The following figure shows (U)SIM card reference circuit.

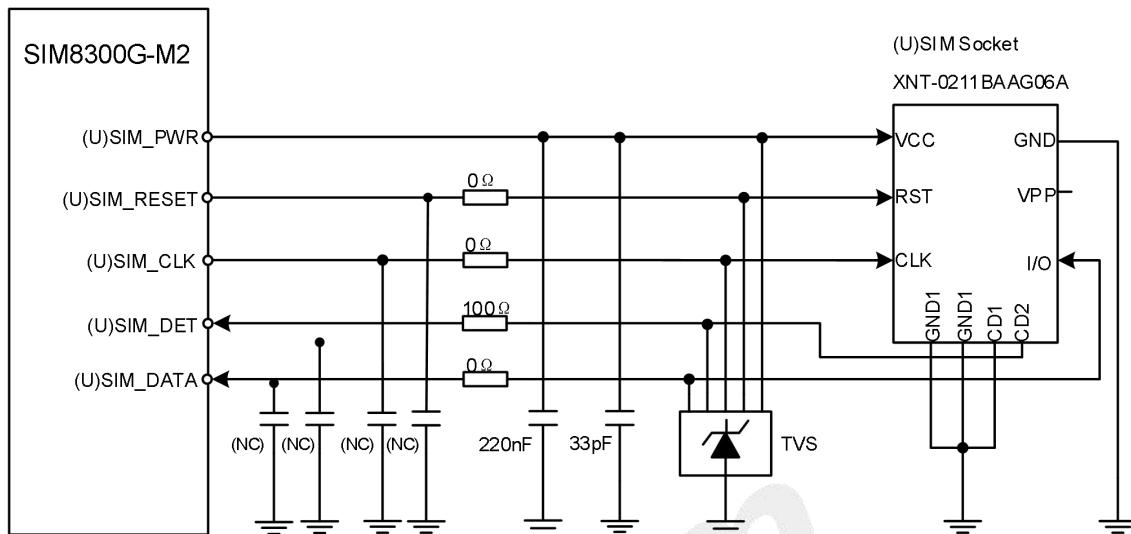

Figure 18: (U)SIM interface reference circuit

When the (U)SIM card is inserted, the (U)SIM_DET will change from high to low level. The falling edge will indicate insertion of the (U)SIM card. When the (U)SIM card is removed, the (U)SIM_DET will change from low to high level. This rising edge will indicate unplug the (U)SIM card.

Using “AT+UIMHOTSWAPON=0 or 1” and “AT+UIMHOTSWAPLEVEL=0 or 1” AT command to set module SIM card hot swap function enable and SIM card detection level, for more details, please refer to SIM8200 Series_AT Command Manual document.

Table 23: Recommended TVS and (U)SIM socket list

Name	Manufacturer	Part number
TVS	ST	ESDA6V1-5W6
(U)SIM socket	Suntech	XNT-0211BAAG06A

If the (U)SIM card hot-swap function is not used, customers can keep the (U)SIM_DET pin open.

The (U)SIM card layout guidelines:

- Make sure that the (U)SIM card holder should be far away from the antenna while in PCB layout.
- (U)SIM traces should keep away from RF lines, VBAT and high-speed signal lines.
- The traces should be as short as possible.
- Keep (U)SIM holder's GND connect to main ground directly.
- Shielding the (U)SIM card signal by ground.
- Recommended to place a 33pF ~ 1uF capacitor on (U)SIM_PWR line and keep close to the holder.
- The rise/fall time of (U)SIM_CLK should not be more than 40ns.
- The parasitic capacitance of TVS should not exceed 60pF and the TVS should be placed close to the (U)SIM socket.

3.9 I2S Interface

SIM8300G-M2 supports one I2S interface for external codec, which follows the requirements in the Phillips I2S bus specification.

Table 24: I2S format

Characteristics	Specification
Line interface format	Linear(Fixed)
Data length	16bits(Fixed)
I2S clock/sync source	Master mode(Fixed)
I2S clock frequency	1.536MHz (Default)
I2S MCLK frequency	12.288MHz (Default)
Data ordering	MSB

NOTE

For the details about I2S AT commands, please refer to [document \[1\]](#) in the appendix.

3.9.1 I2S Timing

The module supports I2S sampling rate of 48 KHz and 32 bit coding signal (16 bit length), the timing sequence is shown in the following figure.

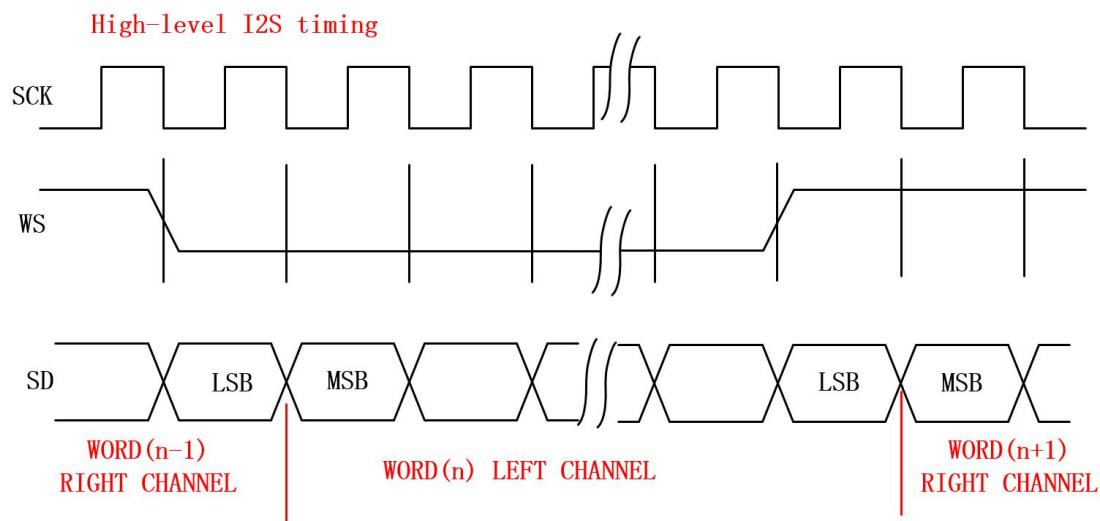

Figure 19: I2S timing

Table 25: I2S timing parameters

Signal	Parameter	Description	Min.	Typ.	Max.	Unit

Audio layout guidelines:

Analog input

- 0.2mm trace widths; 0.2mm spacing between other signals trace.
- Pseudo differential route for MIC.
- Isolate from noise sources, such as antenna, RF signals, SMPS, clocks, and other high speed signals.

Analog output

- Isolate from noise sources such as antenna, RF signals, SMPS, clocks, and other high speed signals.
- Speaker output signal – route as differential pair with 0.5mm trace widths.

Audio power and GND

- Recommend add magnetic bead on AVDD net reserved for debug.
- VDD cannot directly use VBAT as the power supply.
- AGND need add GND via to the main GND plane directly.

3.10 DPR*

DPR (Dynamic Power Reduction) signal is used for SAR (Specific Absorption Rate) sensor requirements. The RF output power would reduce if this signal is triggered by sensor under some certain conditions, such as SAR sensor triggered, defined by customers.

User can activate this function with AT command.

Table 28: Definition of DPR# pin

Pin no.	Pin name	Pin status	Function
25	DPR	Low	Max transmitting power will be reduced by set through AT command

NOTE

1. I2C_SDA and I2C_SCL signal of the module pulled up to 1.8V already.

4. Antenna Interfaces

SIM8300G-M2 provides four antenna interfaces, and all of them should be 50Ω impedance controlled for RF signal.

4.1 Antenna Definitions

Antenna interfaces are shown in the following figure.

Efficiency	> 50 %
Max. Input Power	50W
VSWR	< 2
Polarization	RHCP or Linear
Noise Figure for Active Antenna	< 1.5
Total Gain for Active Antenna	< 17 dB
Cable Insertion Loss	<1.5dB

NOTE

“*” means these recommendations are for dedicated GNSS antenna which the application need best of class GNSS tracking performance.

4.2.2 Antenna Tuner

When the device supports 700MHz(B12、B13、B28) low frequency, it is recommended to add tuner to improve antenna performance. Antenna tuner include antenna aperture tuner, antenna impedance tuner and hybrid tuner of the two. Aperture tuner optimizes the total antenna efficiency from the free space of the antenna terminal, and can optimize antenna efficiency across multiple frequency bands. Impedance tuner adjusts the mismatch between the RF front end and the antenna to achieve maximum power transmission. Hybrid tuner combines the advantages of both to maximize antenna performance. Customers can choose according to their needs, referring to the recommendations of the antenna factory.

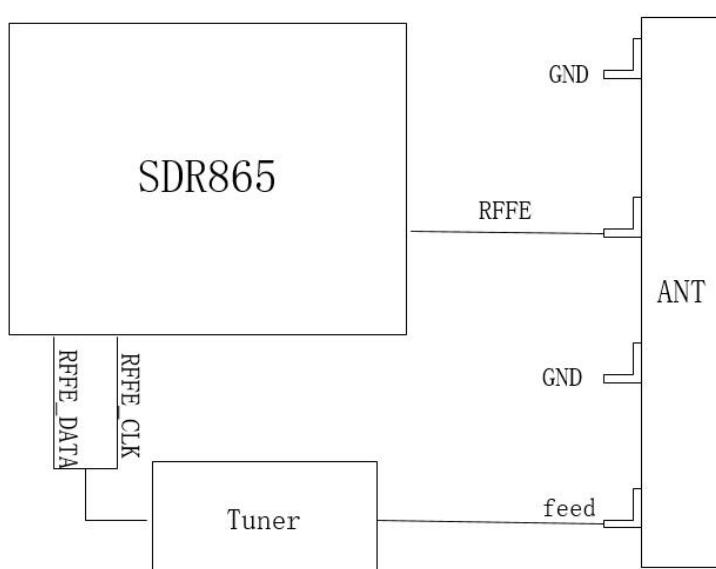

Figure 26: Aperture tuner reference block diagram

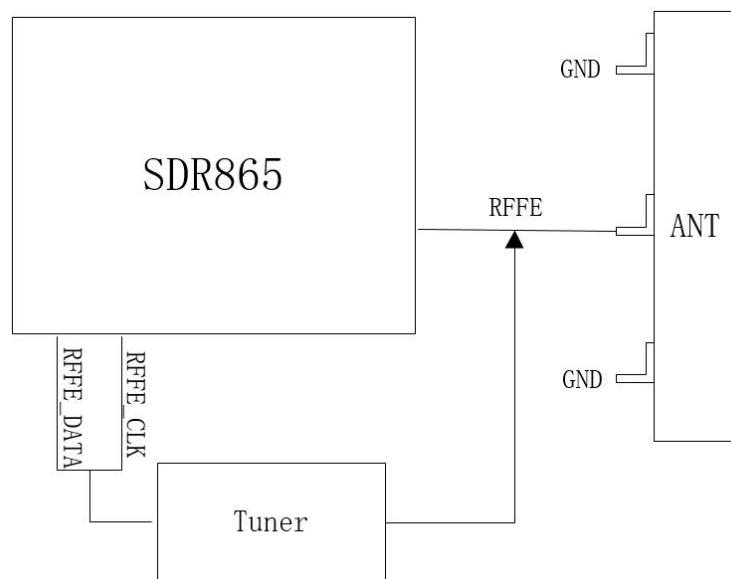

Figure 27: Impedance tuner reference block diagram

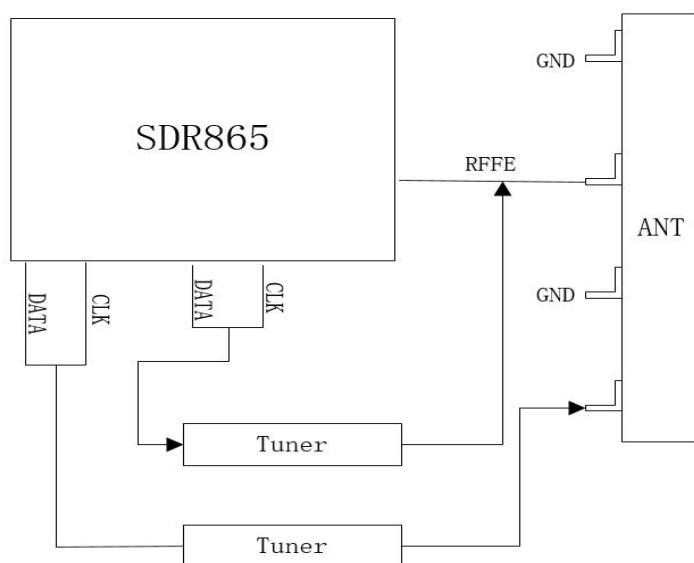

Figure 28: Hybrid tuner reference block diagram

The antenna control Tuner mipi interface of different package modules is as follows.

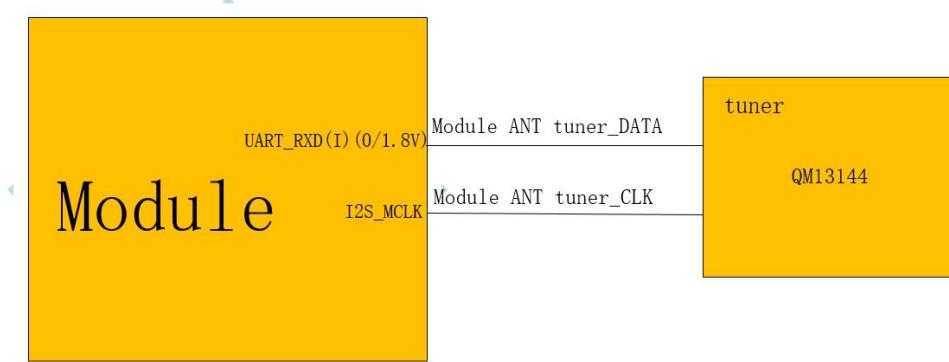

Figure 29: M.2 package Tuner mipi interface

NOTE

When multiple Tuners are needed, pay attention to the distinction of the same device USID under the same group of mipi;

For details please refer to the Antenna Tuner Reference Design document and contact SIMCom support teams.

4.2.3 RF Plug Recommendation

SIM8300G-M2 is mounted with Murata's receptacle RF connectors MM4829-2702B/RA4/RB0, which size is 2.0mm*2.0mm*0.6mm. The connector dimensions are shown as below.

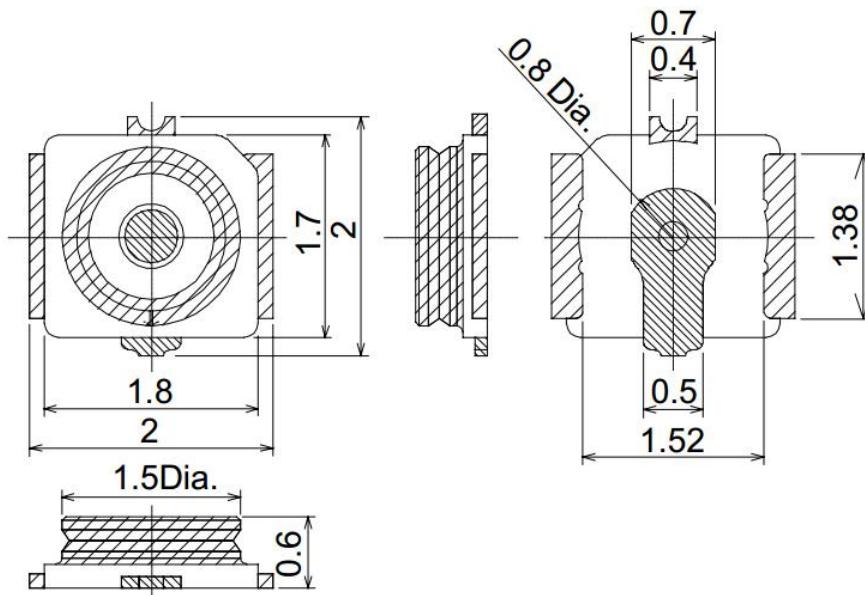

Figure 31: 3D view of MM4829-2702B/ RA4/ RBO

The following table shows the RF connector's electrical specifications.

Table 46: Electrical Specifications of MM4829-2702B/RA4/RB0

Item	Specification
Voltage Rating	250V r.m.s. maximum
Nominal Frequency Range	DC to 6GHz
Nominal Impedance	50Ω
Temperature Rating	-40°C to +85°C
Insulation Resistance	500 MΩ minimum
Withstanding Voltage	No evidence of breakdown
Initial Contact Resistance (without conductor resistance)	Center contact 20.0mΩmax. Outer contact 20.0mΩmax.
Voltage Standing Wave Ratio (V.S.W.R.)	Meet the requirements of 1.3max.(DC~3GHz) 1.45max.(3GHz~6GHz)

To get best RF performance, the RF plug connector should be designed to match the receptacle MM4829-2702B/RA4/RB0, and the parts come from Murata is the recommended.

The following is the mechanical information of the Murata's RF coaxial cable MXHJD3HJ1000 for reference. For further technical support, the customer could visit the Murata's website (www.murata.com) or contact

4.3 mmWave Antenna Installation

The QTM527 is an LGA based millimeter-wave module that includes an integrated RFIC with power management IC and phased antenna array. QTM527 (*4) modules are used for HP CPE applications.

The QTM525 millimeter-wave module includes an integrated RFIC, power management IC, and phased antenna array supporting 5G NR.

4.3.1 SIM8300G to mmWave antenna module connection

SIM8300G to QTM525/QTM527 port assignments have been optimized for IF isolation requirements. Customers must follow the port mapping shown without any change.

5.3 Operating Mode

5.3.1 Operating Mode Definition

The table below summarizes the various operating modes of SIM8300G-M2.

Table 52: Operating mode definition

Mode	Function
Normal operation	UMTS/LTE/5G Sleep AT command "AT+CSCLK=1" can be used to set the module to a sleep mode. In this case, the current consumption of module will be reduced to a very low level and the module can still receive paging message and SMS.
	UMTS/LTE/5G Idle Software is active. Module is registered to the network, and ready to communicate.
	UMTS/LTE/5G Talk Connection between two subscribers is in progress. In this case, the power consumption depends on network settings such as DTX off/on, FR/EFR/HR, hopping sequences, and antennas.
	UMTS/LTE/5G Standby Module is ready for data transmission, but no data is currently sent or received. In this case, power consumption depends on network settings.
	UMTS/LTE/5G Data transmission There is data transmission in progress. In this case, power consumption is related to network settings (e.g. power control level); uplink/downlink data rates, etc.
Minimum functionality mode	AT command "AT+CFUN=0" can be used to set the module to a minimum functionality mode without removing the power supply. In this mode, the RF part of the module will not work and the (U)SIM card will not be accessible, but the serial port and USB port are still accessible. The power consumption in this mode is lower than normal mode.
Flight mode	AT command "AT+CFUN=4" or pulling down the W_disable1# pin can

	be used to set the module to flight mode without removing the power supply. In this case, the RF part of the module will not work, but the serial port and USB are still available. The power consumption is lower than normal mode.
Power off	Normally module will go into power off mode by sending the AT command "AT+CPOF" or pull down the FULL_CARD_POWER_OFF# pin. In this mode the power management unit shuts down the power supply, and software is not active. The serial port and USB are not available.

5.3.2 Sleep Mode*

In sleep mode, the current consumption of the module will be reduced to a very low level.

Several hardware and software conditions must be satisfied in order to let module enter into sleep mode:

1. UART condition
2. USB condition
3. Software condition

NOTE

1. ** means under development.
2. Before designing, pay attention to how to realize sleeping/waking function.

5.3.3 Minimum Functionality Mode and Flight Mode

Minimum functionality mode ceases a majority of functions of the module, in order to minimize the power consumption. This mode is set by the AT command which provides a choice of 3 different functionality levels.

- AT+CFUN=0: Minimum functionality
- AT+CFUN=1: Full functionality (Default)
- AT+CFUN=4: Flight mode

If module has been set to minimum functionality mode, the RF (U)SIM card functions will be closed while the serial port and USB are still available.

If module has been set to flight mode, the RF function will be closed while the (U)SIM card, the serial port and USB are still available.

When module is in minimum functionality or flight mode, it can return to full functionality by the AT command "AT+CFUN=1".

5.4 Current Consumption

The current consumptions are listed in the table below.

Table 53: Current consumption on VBAT pins (VBAT=3.8V)

5.7 Thermal Design

Make sure that the SIM8300G-M2 can reach maximum work performance under extended temperature or extreme conditions for a long time, thermal dissipation design is very important.

It is strongly recommended to add a thermal pad on the customer's main PCB, add thermally conductive material on top of the module as well as between the module and the main PCB. The thermal dissipation area and the dimensions on top and bottom side of the module are shown in the following figure. The dimensions are measured in mm.

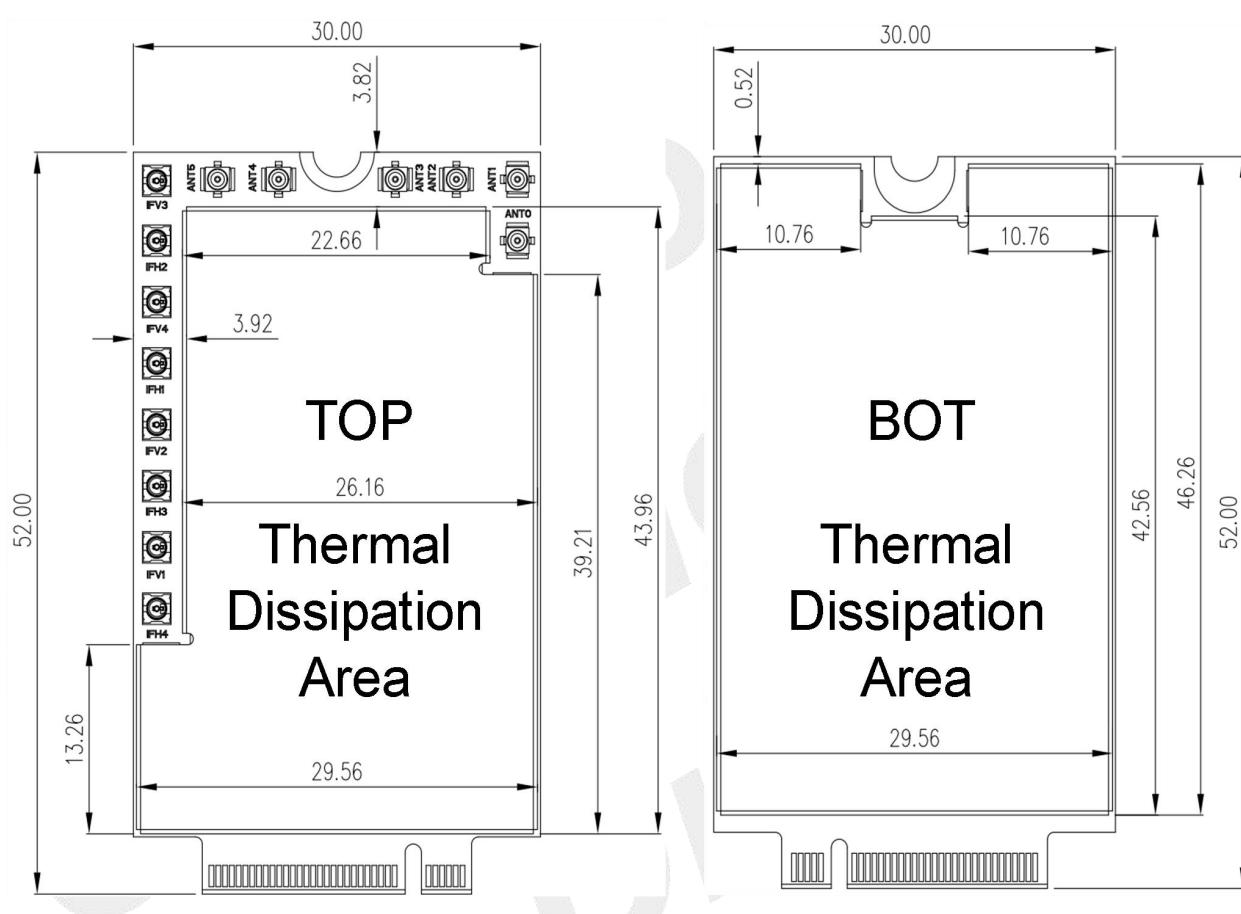

Figure 38: Thermal dissipation area on bottom side of the module

There are some design rules to enhance thermal dissipation performance:

- Keep the module away from other heat sources such as battery, power, AP, etc.
- Make sure that the module mounting holes connect to the main PCB ground fully.
- Add enough through via on the main PCB. Via material is very important solid copper and stacked via is better.
- Make sure maximize airflow around the module.
- Recommend use heat dissipation material connect to the customer's devices on the top side of the module to enhance the heat dissipation. Large thermal dissipation area is better.
- Select a high effective heat dissipation material is better such as heat pipe, graphite sheets. The recommend thermal conductivity is 8w/m-k.

5.8 ESD*

SIM8300G-M2 is sensitive to ESD in the process of storage, transporting, and assembling. When module is mounted on the customer's main board, the ESD components should be placed closed to the connectors which human body may touch, such as (U)SIM card holder, audio jacks, switches, USB interface, etc. The following table shows the module ESD test performance.

8.4 Safety Caution

Table 64: Safety caution

Marks	Requirements
	When in a hospital or other health care facility, observe the restrictions about the use of mobiles. Switch the cellular terminal or mobile off, medical equipment may be sensitive and not operate normally due to RF energy interference.
	Switch off the cellular terminal or mobile before boarding an aircraft. Make sure it is switched off. The operation of wireless appliances in an aircraft is forbidden to prevent interference with communication systems. Forgetting to think much of these instructions may impact the flight safety, or offend local legal action, or both.
	Do not operate the cellular terminal or mobile in the presence of flammable gases or fumes. Switch off the cellular terminal when you are near petrol stations, fuel depots, chemical plants or where blasting operations are in progress. Operation of any electrical equipment in potentially explosive atmospheres can constitute a safety hazard.
	Your cellular terminal or mobile receives and transmits radio frequency energy while switched on. RF interference can occur if it is used close to TV sets, radios, computers or other electric equipment.
	Road safety comes first! Do not use a hand-held cellular terminal or mobile when driving a vehicle, unless it is securely mounted in a holder for hands free operation. Before making a call with a hand-held terminal or mobile, park the vehicle.
	<p>Mobiles operate over radio frequency signals and cellular networks and cannot be guaranteed to connect in all conditions, especially with a mobile fee or an invalid (U)SIM card. While you are in this condition and need emergent help, please remember to use emergency calls. In order to make or receive calls, the cellular terminal or mobile must be switched on and in a service area with adequate cellular signal strength.</p> <p>Some networks do not allow for emergency call if certain network services or phone features are in use (e.g. lock functions, fixed dialing etc.). You may have to deactivate those features before you can make an emergency call.</p> <p>Also, some networks require that a valid (U)SIM card be properly inserted in the cellular terminal or mobile.</p>
